Important Notes About this Manual
Please keep this manual in your Oldsmobile, so it will be there if you ever need it when you're on the road. If you sell the vehicle, please leave this manual in it so the new owner can use it.

This manual includes the latest information at the time it was printed. We reserve the right to make changes in the product after that time without further notice.

Note to Canadian Owners
For vehicles first sold in Canada, substitute the name “General Motors of Canada Limited” for Oldsmobile Division whenever it appears in this manual.

For Canadian Owners Who Prefer a French Language Manual
Aux propriétaires canadiens: Vous pouvez vous procurer un exemplaire de ce guide en français chez votre concessionnaire ou à

Oldsmobile Division
General Motors Corporation
820 Townsend Street
Lansing, Michigan 48921

The word Oldsmobile and the Oldsmobile rocket emblem are registered trademarks of General Motors Corporation.

The word Delco is a registered trademark of General Motors Corporation.
The Power of Intelligent Engineering

Engineering with a purpose. It's at the heart of every Oldsmobile. Your new Oldsmobile continues a 96-year tradition of engineering excellence.

That tradition was born in Lansing, Michigan, on August 31, 1897, when Ransom E. Olds began building a horseless carriage "in as nearly a perfect manner as possible." Soon, Oldsmobiles rode off the nation's first assembly line.

Innovation and refinement have always set Oldsmobiles apart. In 1939, Oldsmobile introduced the celebrated Hydra-Matic transmission, a four-speed forerunner of today's advanced systems. In 1948, the high-spirited Rocket V8 engine set standards for performance.
A Step Ahead

In 1966, Toronado made front-wheel-drive news, including Motor Trend's "Car of the Year." Still breaking new ground, the 1974 "Toro" became the first car equipped with a production "air bag."

Recent Oldsmobile engineering has created exciting advancements like the responsive Quad 4 engine. Versions of the 4-cylinder, 16-valve Quad 4 propelled Oldsmobiles on roads and racetracks to new standards of economy and performance.

Today, the all-wheel-drive security of SmartTraction in the Oldsmobile Bravada continues that proud tradition of meaningful technology.
The Security of Owner Satisfaction

The quality we built into your new Oldsmobile gives us the confidence to back it with the Oldsmobile Edge—the most comprehensive owner satisfaction program in the industry. The Edge gives you 24-hour roadside assistance, Bumper-to-Bumper Plus Warranty protection, even free transportation while your vehicle is in for warranty service. With the Oldsmobile Edge, we've pledged to make your ownership experience a great one.

J. D. Rock
General Manager
How to Use this Manual

Many people read their owner's manual from beginning to end when they first receive their new vehicle. This will help you learn about the features and controls for your vehicle. In this manual, you'll find that pictures and words work together to explain things quickly.

There are nine parts with color-tabbed pages in this manual. Each part begins with a brief list of contents, so you can usually tell at a glance if that part contains the information you want.

You can bend the manual slightly to reveal the color tabs that help you find a part.

Part 1: Seats & Safety Belts
This part tells you how to use your seats and safety belts properly.

Part 2: Features & Controls
This part explains how to start and operate your Oldsmobile.

Part 3: Comfort Controls & Audio Systems
This part tells you how to adjust the ventilation and comfort controls and how to operate your audio system.

Part 4: Your Driving and the Road
Here you'll find helpful information and tips about the road and how to drive under different conditions.

Part 5: Problems on the Road
This part tells you what to do if you have a problem while driving, such as a flat tire or engine overheating.
Part 6: Service & Appearance Care
Here the manual tells you how to keep your Oldsmobile running properly and looking good.

Part 7: Maintenance Schedule
This part tells you when to perform vehicle maintenance and what fluids and lubricants to use.

Part 8: Customer Assistance Information
This part tells you how to contact Oldsmobile for assistance and how to get service publications. It also gives you information on Reporting Safety Defects.

Part 9: Index
Here's an alphabetical listing of almost every subject in this manual. You can use it to quickly find something you want to read.

Service Station Information:
This is a quick reference of service information. You can find it on the last page of this manual.
How to Use this Manual

Safety Warnings and Symbols
You will find a number of safety cautions in this book. We use yellow and the word CAUTION to tell you about things that could hurt you if you were to ignore the warning.

CAUTION
These mean there is something that could hurt you or other people.

In the yellow caution area, we tell you what the hazard is. Then we tell you what to do to help avoid or reduce the hazard. Please read these cautions. If you don’t, you or others could be hurt.

You will also find a red circle with a slash through it in this book. This safety symbol means:

Don’t
Don’t do this
Don’t let this happen

Vehicle Damage Warnings
Also, in this book you will find these blue notices:

NOTICE
These mean there is something that could damage your vehicle.

In the blue notice area, we tell you about something that can damage your vehicle. Many times, this damage would not be covered by your warranty, and it could be costly. But the notice will tell you what to do to help avoid the damage.

When you read other manuals, you might see CAUTION and NOTICE warnings in different colors or in different words. In this manual, we’ve used the familiar words and colors that Oldsmobile has used for years. You’ll also see warning labels on your vehicle. They use the same colors, and the words CAUTION or NOTICE.
Vehicle Symbols
These are some of the symbols you will find on your vehicle. For example, these symbols are used on an original battery:

- Caution Possible Injury
- Protect Eyes by Shielding
- Caustic Battery Acid Could Cause Burns
- Avoid Sparks or Flames
- Spark or Flame Could Explode Battery

These symbols are important for you and your passengers whenever your vehicle is driven:

- Fasten Safety Belts
- Door Lock/Unlock

These symbols have to do with your lights:

- Master Lighting Switch
- Turn Signal Direction
- Hazard Warning Flashers
- Headlight High Beam
- Parking Lights
- Fog Lights

**Seats & Safety Belts**

- **Seats and Seat Controls**
  This section tells you about the seats—how to adjust them—and also about reclining seatbacks and head restraints.

- **Manual Front Seat**

  **CAUTION**

  You can lose control of the vehicle if you try to adjust a manual driver's seat while the vehicle is moving. The sudden movement could startle and confuse you, or make you push a pedal when you don't want to. Adjust the driver's seat only when the vehicle is not moving.

  To adjust the seat forward or back, lift the handle. After it's adjusted, release the handle and try to move the seat to be certain it has locked into place.
**Manual Four-Way Seat Adjuster (OPTION)**

To tilt the whole seat forward or backward, squeeze the lever. Position the seat where you would like it, then release the lever.

**Six-Way Power Seat (OPTION)**

To Adjust the Six-Way Power Seat:

- **Front Control (A):** Raise the front of the seat by holding the switch up. Hold the switch down to lower the front of the seat.

- **Center Control (B):** Move the seat forward or back by holding the control to the front or back. Raise or lower the seat by holding the control up or down.

- **Rear Control (C):** Raise the rear of the seat by holding the switch up. Hold the switch down to lower the rear of the seat.
Seats & Safety Belts

Four-Way Power Articulation Control (common)
The adjustable support control allows you to change the contour of the driver and passenger seats. It works independently of the power seat control. Adjust your seat for proper position first, then adjust the contour.
To adjust the driver's seat, move the selector switch to LT. To adjust the passenger seat, move the selector switch to RT. To lock controls, leave the selector switch in the middle.

There are Four Adjustment Switches:

- **Lumbar Support:** Hold the switch forward to raise the area behind the small of the back. Hold the switch rearward to lower.
- **Head Support:** Hold the switch forward to move the head restraint forward, Hold rearward to move it back.
- **Thigh Support:** Hold the switch forward to raise the thigh area. Hold the switch rearward to lower.
- **Side Bolster Support:** Hold the switch forward to raise the outside of the seat. Hold the switch rearward to lower.

Reclining Front Seatbacks
Lift the lever to release the seatback, then tilt the seatback forward or backward, as desired. Release the lever to lock the seatback in place. But don't have a seatback reclined if your vehicle is moving.
CAUTION

Sitting in a reclined position when your vehicle is in motion can be dangerous. Even if you buckle up, your safety belts can’t do their job when you’re reclined like this.

The shoulder belt can’t do its job because it won’t be against your body. Instead, it will be in front of you. In a crash you could go into it, receiving neck or other injuries.

The lap belt can’t do its job either. In a crash the belt could go up over your abdomen. The belt forces would be there, not at your pelvic bones. This could cause serious internal injuries.

For proper protection when the vehicle is in motion, have the seatback upright. Then sit well back in the seat and wear your safety belt properly.

Head Restraints

Slide the head restraint up or down so that the top of the restraint is closest to the top of your ears. This position reduces the chance of a neck injury in a crash.
Seats & Safety Belts

Seatback Latches
In 2-door Oldsmobiles, the front seat folds forward to let people get into the back seat.
Your seatback will move back and forth freely, unless you come to a sudden stop. Then it will lock in place.
There's one time the seatback may not fold without some help from you. That's if your vehicle is parked facing down a fairly steep hill.
To fold a seatback forward, push the seatback toward the rear as you lift this latch. Then the seatback will fold forward. The latch must be down for the seat to work properly.

Safety Belts:
A loose seatback can cause an injury in a sudden stop.

Split Fold-Down Rear Seat
(OPTION)
To Open: Pull forward on the seat tab.
To Close: Push the seatback up to its original position.
Check latch resistance regularly by pulling on the seat tab. If the seatback does not latch securely, have it repaired right away. A loose seatback can cause an injury in a sudden stop.

Seatback Latches
In 2-door Oldsmobiles, the front seat folds forward to let people get into the back seat.
Your seatback will move back and forth freely, unless you come to a sudden stop. Then it will lock in place.
There's one time the seatback may not fold without some help from you. That's if your vehicle is parked facing down a fairly steep hill.
To fold a seatback forward, push the seatback toward the rear as you lift this latch. Then the seatback will fold forward. The latch must be down for the seat to work properly.

Check latch resistance regularly by pulling on the seat tab. If the seatback does not latch securely, have it repaired right away. A loose seatback can cause an injury in a sudden stop.

Safety Belts:
They're For Everyone
This part of the manual tells you how to use safety belts properly. It also tells you some things you should not do with safety belts.

CAUTION
Don't let anyone ride where they can't wear a safety belt properly. If you are in a crash and you're not wearing a safety belt, your injuries can be much worse. You can hit things inside the vehicle or be ejected from it. You can be seriously injured or killed. In the same crash, you might not be if you are buckled up. Always fasten your safety belt, and check that your passengers' belts are fastened properly too.
This figure lights up when you turn the key to Run or Start when your safety belt isn't buckled, and you'll hear a chime, too. It's the reminder to buckle up. In many states and Canadian provinces, the law says to wear safety belts. Here's why: **They work.**

You never know if you'll be in a crash. If you do have a crash, you don't know if it will be a bad one.

A few crashes are very mild. In them, you won't get hurt, even if you're not buckled up. And some crashes can be so serious, like being hit by a train, that even buckled up a person wouldn't survive. But most crashes are in between. In many of them, people who buckle up can survive and sometimes walk away. Without belts they could be badly hurt or killed.

After 25 years of safety belts in vehicles, the facts are clear. In most crashes buckling up does matter...a lot.
Seats & Safety Belts

Why Safety Belts Work
When you ride in or on anything, you go as fast as it goes.

1. For example, if the bike is going 10 mph (16 km/h), so is the child.

2. When the bike hits the block, it stops. But the child keeps going!

3. Take the simplest “car.” Suppose it's just a seat on wheels.
4. Put someone on it.

5. Get it up to speed. Then stop the "car." The rider doesn’t stop.

6. The person keeps going until stopped by something. In a real vehicle, it could be the windshield... 

With safety belts, you slow down as the vehicle does. You get more time to stop. You stop over more distance, and your strongest bones take the forces. That’s why safety belts make such good sense.
Here Are Questions Many People Ask About Safety Belts—and the Answers

Q: Won't I be trapped in the vehicle after an accident if I'm wearing a safety belt?
A: You could be—whether you're wearing a safety belt or not. But you can easily unbuckle a safety belt, even if you're upside down. And your chance of being conscious during and after an accident, so you can unbuckle and get out, is much greater if you are belted.

Q: Why don't they just put in air bags so people won't have to wear safety belts?
A: "Air bags," or Supplemental Inflatable Restraint systems, are in some vehicles today and will be in more of them in the future. But they are supplemental systems only—so they work with safety belts, not instead of them. Every "air bag" system ever offered for sale has required the use of safety belts. Even if you're in a vehicle that has "air bags," you still have to buckle up to get the most protection. That's true not only in frontal collisions, but especially in side and other collisions.

Q: If I'm a good driver, and I never drive far from home, why should I wear safety belts?
A: You may be an excellent driver, but if you're in an accident—even one that isn't your fault—you and your passengers can be hurt. Being a good driver doesn't protect you from things beyond your control, such as bad drivers.

Most accidents occur within 25 miles (40 km) of home. And the greatest number of serious injuries and deaths occur at speeds of less than 40 mph (65 km/h).

Safety belts are for everyone.
There are special things to know about safety belts and children. And there are different rules for babies, and smaller children. If a child will be riding in your Oldsmobile, see the Index under Children. Follow those rules for everyone's protection.

CAUTION

If your safety belt light ever comes on or stays on after the front doors are closed and the driver's belt is buckled, have your vehicle fixed.

If you don't, you might not have the protection you'd need in a crash.

How to Wear Safety Belts Properly—Adults

This section is only for people of adult size.

CAUTION

There are special things to know about safety belts and children. And there are different rules for babies, and smaller children. If a child will be riding in your Oldsmobile, see the Index under Children. Follow those rules for everyone's protection.

First, you'll want to know which restraint systems your vehicle has. We'll start with the driver position.

Vehicles First Sold in Canada

Was your Oldsmobile first sold, when new, in Canada? (If it was, a sticker on the driver's door will say "conforms to all applicable Canada motor vehicle..." etc.) If so, then the rest of Part 1 does not apply to your vehicle.

To learn how to use your safety belts, please read the Owner's Manual Safety Belt Supplement. It comes with every new Oldsmobile first sold in Canada.
Driver Position
This section describes the driver's restraint system.

Automatic Lap-Shoulder Belt
This safety belt is called "automatic" because you don't have to buckle up when you get into your vehicle.

And you don't have to unbuckle when you get out.
Just get into your vehicle. Then close and lock the door. Adjust the seat (to see how, see the Index under Seat Controls) so you can sit up straight.
The lap belt should be worn as low on the hips as possible. In a crash, this applies force to the strong pelvic bones. And you'd be less likely to slide under the lap belt. If you slid under it, the belt would apply force at your abdomen. This could cause serious or even fatal injuries. The shoulder belt should go over the shoulder and across the chest. These parts of the body are best able to take belt restraining forces.

The safety belt locks if there's a sudden stop or a crash.

It's possible that an automatic belt could keep you from fully opening a door. That can happen if the door was slammed shut very hard. Just close the door all the way, then slowly open it. If that doesn't fix it, then your Oldsmobile needs service.

We hope you will always keep your automatic belt buckled. However, you may need to unbuckle it in an emergency.

And you would need to unbuckle it to let someone get into the center front seat position, if your vehicle has one.

To Unbuckle the Automatic Belt:
Just push the button on the buckle.
Seats & Safety Belts

Automatic Lap-Shoulder Belt (CONT.)
To Reattach the Automatic Belt:
1. Close and lock the door.
2. Adjust the seat (to see how, see the Index under Seat Controls) so you can sit up straight.
3. Pick up the latch plate and pull the belt across you. Don’t let it get twisted.
4. Push the latch plate into the buckle until it clicks.

Q: What’s wrong with this?
A: The shoulder belt is too loose. It won’t give nearly as much protection this way.

Q: What’s wrong with this?
A: The belt is buckled in the wrong place.

CAUTION
You can be seriously hurt if your shoulder belt is too loose. In a crash, you would move forward too much, which could significantly increase injury. The shoulder belt should fit against your body.

CAUTION
You can be seriously injured if your belt is buckled in the wrong place like this. In a crash, the belt would go up over your abdomen. The belt forces would be there, not at the pelvic bones. This could cause serious internal injuries. Always buckle your belt into the buckle nearest you.
Q: What's wrong with this?
A: The shoulder belt is worn under the arm. It should be worn over the shoulder at all times.

CAUTION
You can be seriously injured if you wear the shoulder belt under your arm. In a crash, your body would move too far forward, which would increase the chance of head and neck injury. Also, the belt would apply too much force to the ribs, which aren't as strong as shoulder bones. You could also severely injure internal organs like your liver or spleen.

Q: What's wrong with this?
A: The belt is twisted across the body.

CAUTION
You can be seriously injured by a twisted belt. In a crash, you wouldn't have the full width of the belt to take impact forces. If a belt is twisted, make it straight so it can work properly, or ask your dealer to fix it.

Safety Belt Use During Pregnancy

Safety belts work for everyone, including pregnant women. Like all occupants, they are more likely to be seriously injured if they don't wear safety belts.

A pregnant woman should wear a lap-shoulder belt, and the lap portion should be worn as low as possible throughout the pregnancy. The best way to protect the fetus is to protect the mother. When a safety belt is worn properly, it's more likely that the fetus won't be hurt in a crash. For pregnant women, as for anyone, the key to making safety belts effective is wearing them properly.
Right Front Passenger Position
The right front passenger's safety belt works the same way as the driver's safety belt.
See the Index under Driver Position.

Adjust the seat (to see how, see the Index under Seat Controls) so you can sit up straight. Move your seat far enough forward that your feet touch the part of the vehicle that is called the "toeboard" (A). That way you'd be less likely to slide under the lap belt in a crash.

Center Passenger Position
If your vehicle has a bench seat, someone can sit in the center position. When you sit in a center seating position, you have a lap safety belt, which has no retractor.
To make the belt longer, tilt the latch plate and pull it along the belt.

To make the belt shorter, pull its free end as shown until the belt is snug. Buckle, position and release it the same way as the lap part of a lap-shoulder belt. If the belt isn't long enough, see the Index under Safety Belt Extender. Make sure the release button on the buckle faces upward or outward so you would be able to unbble it quickly if you ever had to.

Rear Seat Passengers

It's very important for rear seat passengers to buckle up! Accident statistics show that unbelted people in the rear seat are hurt more often in crashes than those who are wearing safety belts.

Rear passengers who aren't safety belted can be thrown out of the vehicle in a crash. And they can strike others in the vehicle who are wearing safety belts.
Rear Seat Outside Passenger Positions

The positions next to the windows have lap-shoulder belts.

Here's How to Wear One Properly:
1. Pick up the latch plate and pull the belt across you. Don't let it get twisted.
2. Push the latch plate into the buckle until it clicks.

If the belt stops before it reaches the buckle, tilt the latch plate and keep pulling until you can buckle it.

If the belt is not long enough, see the Index under Safety Belt Extender.
Make sure the release button on the buckle faces upward or outward so you would be able to unbuckle it quickly if you ever had to.
3. To make the lap part tight, pull down on the buckle end of the belt as you pull up on the shoulder part.

The lap part of the belt should be worn low and snug on the hips, just touching the thighs. In a crash, this applies force to the strong pelvic bones. And you'd be less likely to slide under the lap belt. If you slid under it, the belt would apply force at your abdomen. This could cause serious or even fatal injuries. The shoulder belt should go over the shoulder and across the chest. These parts of the body are best able to take belt restraining forces.

The safety belt locks if there's a sudden stop or a crash.

**CAUTION**

⚠️ You can be seriously hurt if your shoulder belt is too loose. In a crash you would move forward too much, which could increase injury. The shoulder belt should fit against your body.
Seats & Safety Belts

Rear Seat Outside Passenger Positions (cont.)

To unlatch the belt, just push the button on the buckle.

- Children

Everyone in a vehicle needs protection! That includes infants and all children smaller than adult size. In fact, the law in every state and Canadian province says children up to some age must be restrained while in a vehicle.

CAUTION

Smaller children and babies should always be restrained in a child or infant restraint. The instructions for the restraint will say whether it is the right type and size for your child. A very young child’s hip bones are so small that a regular belt might not stay low on the hips, as it should. Instead, the belt will likely be over the child’s abdomen. In a crash the belt would apply force right on the child’s abdomen, which could cause serious or fatal injuries. So, be sure that any child small enough for one is always properly restrained in a child or infant restraint.
Never hold a baby in your arms while riding in a vehicle. A baby doesn't weigh much—until a crash. During a crash a baby will become so heavy you can't hold it. For example, in a crash at only 25 mph (40 km/h), a 12-pound (5.5 kg) baby will suddenly become a 240-pound (110 kg) force on your arms. The baby would be almost impossible to hold.

(Continued)

CAUTION

(Continued)
Secure the baby in an infant restraint.

Child Restraints

Be sure to follow the instructions for the restraint. You may find these instructions on the restraint itself or in a booklet, or both. These restraints use the belt system in your vehicle, but the child also has to be secured within the restraint to help reduce the chance of personal injury. The instructions that come with the infant or child restraint will show you how to do that.
Where to Put the Restraint

Accident statistics show that children are safer if they are restrained in the rear rather than the front seat. We at General Motors therefore recommend that you put your child restraint in the rear seat unless the child is an infant and you're the only adult in the vehicle. In that case, you might want to secure the restraint in the front seat where you can keep an eye on the baby.

Wherever you install it, be sure to secure the child restraint properly.

Top Strap

If your child restraint has a top strap, it should be anchored. If you need to have an anchor installed, you can ask your Oldsmobile dealer to put it in for you. If you want to install an anchor yourself, your dealer can tell you how to do it. Vehicles first sold in Canada have child restraint anchor bracket hardware in the glove box, along with instructions for installing it. This should be used only with a child restraint, and only to secure a child restraint at a rear seating position. Additional anchor brackets for child restraints at the rear seating positions are available at Oldsmobile dealerships in Canada.

CAUTION

An unsecured child restraint can move around in a collision or sudden stop and injure people in the vehicle. Be sure to properly secure any child restraint in your vehicle—even when no child is in it.
1. Put the restraint on the seat. Follow the instructions for the child restraint.
2. Secure the child in the child restraint as the instructions say.
3. Pull out the vehicle’s safety belt and run the lap part through or around the restraint. The child restraint instructions will show you how. Tilt the latch plate to adjust the belt if needed. See if the shoulder belt would go in front of the child’s face or neck. If so, put it behind the child restraint.
4. Buckle the belt. Make sure the release button faces upward or outward, so you’ll be able to unbuckle it quickly if you ever need to.
5. To tighten the belt, pull up on the shoulder belt while you push down on the child restraint.
Securing a Child Restraint in a Rear Outside Position (CONT.)

6. Push and pull the child restraint in different directions to be sure it is secure.

To remove the child restraint, just unbuckle the vehicle’s safety belt and let it go back all the way. The safety belt will move freely again and be ready to work for an adult or larger child passenger.

Securing a Child Restraint in a Center Seat Position

When you secure a child restraint in a center seating position, you’ll be using the lap belt. See the earlier section about the top strap if the child restraint has one.
1. Make the belt as long as possible by tilting the latch plate and pulling it along the belt.
2. Put the restraint on the seat. Follow the instructions for the child restraint.
3. Secure the child in the child restraint as the instructions say.

4. Run the vehicle's safety belt through or around the restraint. The child restraint instructions will show you how.
5. Buckle the belt. Make sure the release button faces upward or outward, so you'll be able to unbuckle it quickly if you ever need to.
6. To tighten the belt, pull on free end while you push down on the child restraint.

7. Push and pull the child restraint in different directions to be sure it is secure. If the child restraint isn't secure, turn the latch plate over and buckle it again. Then see if it is secure. If it isn't, secure the restraint in a different place in the vehicle and contact the child restraint maker for their advice.
To remove the child restraint, just unbuckle the vehicle's safety belt. It will be ready to work for an adult or larger child passenger.
Securing a Child Restraint in the Right Front Seat

To use a child restraint here, you will need a special infant/child seat attaching belt and the hardware that goes with it. See the earlier section about the top strap if the child restraint has one.

Your dealer can get these and install the hardware for you. It’s free. The special belt is GM Part No. 12340286. Your dealer can find the correct hardware in the accessory section of the GM Parts Catalog.

CAUTION

Don’t use the special infant/child seat attaching hardware in another vehicle. If you do, it may not work well and the child may not be protected properly in a crash. The special hardware is for your vehicle only.

Also, don’t use the special belt for anything but securing a child restraint in the right front seat. If an adult or older child uses it, the belt won’t provide protection and may even increase injury in a crash.
Once the special hardware is installed, please follow the instructions with it and these steps:

1. Unbuckle the automatic lap-shoulder belt by pushing the button on the buckle. It will stay on the door, ready to be rebuckled for use by adults or older children.

2. Snap one hook of the infant/child seat attaching belt near the floor at the door side of the seat.

3. Put the belt's special latch plate into the vehicle's safety belt buckle.
Securing a Child Restraint in the Right Front Seat (cont.)

4. You can make the belt longer by tilting the buckle and pulling it along the belt.

5. Put the restraint on the seat. Follow the instructions for the child restraint.

6. Secure the child in the child restraint as the instructions say.

7. Run the belt through or around the child restraint. The child restraint instructions will show you how.

8. Put the hook on the free end through the slot in the latch plate.

9. To make it tight, pull the belt while you push down on the child restraint. If the belt won’t stay tight, switch it end for end.

10. Push and pull the child restraint in different directions to be sure it is secure.
To Remove the Infant/Child Seat Restraint

1. Push the button on the safety belt buckle and remove the special latch plate. Leave the latch plate on the special belt.

2. Push the spring on the hook near the door and remove the special belt.

3. Put the belt away in a safe place in your vehicle, so it won’t fly around in a crash and injure someone.

4. Remember to reattach the automatic belt again, once the child restraint is removed. Be sure it isn’t twisted.

Larger Children

Children who have outgrown child restraints should wear the vehicle’s safety belts.

If you have the choice, a child should sit next to a window so the child can wear a lap-shoulder belt and get the additional restraint a shoulder belt can provide.

Accident statistics show that children are safer if they are restrained in the rear seat. But they need to use the safety belts properly.

* Children who aren’t buckled up can be thrown out in a crash.
Larger Children (cont.)

- Children who aren't buckled up can strike other people who are.

CAUTION

Never do this.
Here two children are wearing the same belt. The belt can’t properly spread the impact forces. In a crash, the two children can be crushed together and seriously injured. A belt must be used by only one person at a time.

Q: What if a child is wearing a lap-shoulder belt, but the child is so small that the shoulder belt is very close to the child’s face or neck?

A: Move the child toward the center of the vehicle, but be sure that the shoulder belt still is on the child’s shoulder, so that in a crash the child’s upper body would have the restraint that belts provide.

If the child is so small that the shoulder belt is still very close to the child’s face or neck, you might want to place the child in the center seat position, the one that has only a lap belt.
CAUTION

Never do this.

Here a child is sitting in a seat that has a lap-shoulder belt, but the shoulder part is behind the child. If the child wears the belt in this way, in a crash the child might slide under the belt. The belt’s force would then be applied right on the child’s abdomen. That could cause serious or fatal injuries.

Whenever the child sits, the lap portion of the belt should be worn low and snug on the hips, just touching the child’s thighs. This applies belt force to the child’s pelvic bones in a crash.

Safety Belt Extender

If the vehicle’s safety belt will fasten around you, you should use it. The automatic lap-shoulder belt has plenty of extra length built in, so it will fasten around almost all people. But if a safety belt isn’t long enough to fasten, your dealer will order you an extender. It’s free. When you go in to order it, take the heaviest coat you will wear, so the extender will be long enough for you. The extender will be just for you, and just for the seat in your vehicle that you choose. Don’t let someone else use it, and use it only for the seat it is made to fit. To wear it, just attach it to the regular safety belt.
Checking Your Restraint Systems
Now and then, make sure all your belts, buckles, latch plates, retractors, anchorages and reminder systems are working properly. Look for any loose parts or damage. If you see anything that might keep a restraint system from doing its job, have it repaired.

Replacing Safety Belts After a Crash
If you've had a crash, do you need new belts?

After a very minor collision, nothing may be necessary. But if the belts were stretched, as they would be if worn during a more severe crash, then you need new belts.

If you ever see a label on a right front safety belt that says to replace the belt, be sure to do so. Then it will be there to help protect you in an accident. You would see this label on the belt near the door opening.

If belts are cut or damaged, replace them. Collision damage also may mean you will have to have safety belt parts, like the retractor, replaced or anchorages locations repaired—even if the belt wasn't being used at the time of the collision.
Q: What’s wrong with this?
A: The belt is torn.

CAUTION

Torn or frayed belts may not protect you in a crash. They can rip apart under impact forces. If a belt is torn or frayed, get a new one right away.
Part 2
Features & Controls

Here you can learn about the many standard and optional features on your Oldsmobile, and information on starting, shifting and braking. Also explained are the instrument panel and the warning systems that tell you if everything is working properly—and what to do if you have a problem.

</table>
Leaving young children in a vehicle with the ignition key is dangerous for many reasons. A child or others could be badly injured or even killed. They could operate power windows or other controls, or even make the vehicle move. Don't leave the keys in a vehicle with young children.

The ignition keys are for the ignition only.

The door keys are for the doors and all other locks.

When a new Oldsmobile is delivered, the dealer removes the plugs from the keys, and gives them to the first owner. Each plug has a code on it that tells your dealer or a qualified locksmith how to make extra keys. Keep the plugs in a safe place. If you lose your keys, you'll be able to have new ones made easily using these plugs.

NOTICE

Your Oldsmobile has a number of new features that can help prevent theft. But you can have a lot of trouble getting into your vehicle if you ever lock your keys inside. You may even have to damage your vehicle to get in. So be sure you have extra keys.
Door Locks

CAUTION

Unlocked doors can be dangerous.
Passengers—especially children—can easily open the doors and fall out. When a door is locked, the inside handle won’t open it.
Outsiders can easily enter through an unlocked door when you slow down or stop your vehicle.
This may not be so obvious: You increase the chance of being thrown out of the vehicle in a crash if the doors aren’t locked. Wear safety belts properly, lock your doors, and you will be far better off whenever you drive your vehicle.

There are several ways to lock and unlock your vehicle.
From the Outside:
Use your door key or Remote Lock Control, if your vehicle has this option.

From the Inside:
To lock the door, push down the locking lever. To unlock, push the lever up.
**Features & Controls**

**Power Door Locks**
You can lock or unlock all doors of your vehicle from the driver or passenger door lock switch.
On 4-door models, the switch on each rear door works only that door's lock. It won't lock (or unlock) all of the doors—that's a safety feature.

**Leaving Your Vehicle**
If you are leaving the vehicle, open your door and set the locks from inside, then get out and close the door.

**Automatic Door Locks**
Just close your doors and turn on the ignition. All of the doors will lock when you move your shift lever out of P (Park) or N (Neutral). Each time you close your doors and turn on the ignition, the doors will lock automatically only once. If someone needs to get out while the vehicle is running, have that person use the manual or power lock. When the door is closed again, it will not lock automatically. Just use the manual or power lock to lock the door again.
Remote Lock Control (Option)

If your Oldsmobile has this option, you can lock and unlock your doors or unlock your trunk from up to 30 feet (9 m) away using the key chain transmitter supplied with your vehicle.

Operation

When you press and release UNLOCK, the driver's door will unlock and the interior lights will come on. They'll stay on for 40 seconds, or until you turn the ignition to ON.

Press and release UNLOCK a second time within five seconds to unlock the passenger door or doors.

To lock all doors, press DOOR. The interior lights will come on for two seconds to show the lock function has worked. If you first press UNLOCK and then press DOOR within 40 seconds, the interior lights will stay on until the 40 seconds are over.

Press UNLOCK to unlock the trunk. Your interior lights will not come on.

Matching Transmitter(s) to Your Vehicle

Each keychain transmitter is coded to prevent another transmitter from unlocking your vehicle. If a transmitter is lost or stolen, a replacement can be purchased through your dealer.

Remember to bring the remaining transmitter with you when you go to your dealer. When the dealer matches the replacement transmitter to your vehicle, the remaining transmitter must also be matched. Once the new transmitter is coded, the lost transmitter will not unlock your vehicle.

You can match a transmitter to as many vehicles as you own, provided they are equipped with exactly the same model system. (General Motors offers several different models of these systems on their vehicles.) Each vehicle can have only two transmitters matched to it.

See your dealer to match transmitters to another vehicle.

Your Remote Lock Control operates on a radio frequency subject to Federal Communications Commission (FCC) Rules.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.
Remote Lock Control (cont.)

Should interference to this system occur, try this:
- Check to determine if battery replacement is necessary. See the instructions on battery replacement later in this section.
- Check the distance. You may be too far from your vehicle. This product has a maximum range.
- Check the location. Other vehicles or objects may be blocking the signal.
- See your Oldsmobile dealer or a qualified technician for service.

Changes or modifications to this system by other than an authorized service facility could void authorization to use this equipment.

Battery Replacement

Under normal use, the batteries in your key chain transmitter should last about two years. You can tell the batteries are weak if the transmitter won't work at the normal range in any location. If you have to get close to your vehicle before the transmitter works, it's probably time to change the batteries.

To Replace Batteries in the Remote Lock Control:
1. If your transmitter has a screw, remove the screw from the back cover. If it doesn't have a screw, pop the cover off by inserting a dime (or similar object) in the slot between the covers and twisting.
2. Lift the front cover off, bottom half first.
3. Remove and replace the two batteries
4. Reassemble the transmitter.
5. Check the transmitter operation.

Battery Replacement

Programming the Module

You will need to program your Remote Lock Control module if any of the following things occur:

- You replace your Remote Lock Control transmitter;
- You add a second transmitter;
- Something grounds the data encoder;
- You replace the Remote Lock Control module.

To program the module, you’ll need the transmitter and a short length of wire, about 3 feet (1 m) long. Then follow these steps:

1. Open the trunk and locate the data encoder connector (A). It’s on the right side, above the wheel well.
2. Attach one end of the grounding wire to the stud inside the data encoder connector terminal.
3. Attach the other end of the wire to a ground (B).
4. Press any button on the transmitter once. Wait for the locks to fully cycle. If you have a second portable transmitter, press any button on it once, also. Wait for the locks to fully cycle. Your module is now programmed.
5. Disconnect the wire from the data encoder connector and the ground.

Theft

Vehicle theft is big business, especially in some cities.

Although your Oldsmobile has a number of theft-deterrent features, we know that nothing we put on it can make it impossible to steal. However, there are ways you can help.

Key in the Ignition: If you walk away from your vehicle with the keys inside, it’s an easy target for joy riders or professional thieves—so don’t do it.

When you park your Oldsmobile and open the driver’s door, you’ll hear a tone reminding you to remove your key from the ignition and take it with you. Always do this. Your steering wheel will be locked, and so will your ignition and transaxle. And remember to lock the doors.
Theft (CONT.)
Parking at Night:  Park in a lighted spot, close all windows and lock your vehicle. Remember to keep your valuables out of sight. Put them in a storage area, or take them with you.
Parking Lots:  If you park in a lot where someone will be watching your vehicle, it’s best to lock it up and take your keys. But what if you have to leave your ignition key? What if you have to leave something valuable in your vehicle?
- Put your valuables in a storage area, like your trunk or glove box.
- Lock all the doors except the driver’s.
- Then take the door key with you.

Lock Finder
On 2-door models only, pull the driver’s door handle to light the door lock for a few seconds. This helps you find the lock when it’s dark.

Trunk Lock
To unlock the trunk from the outside, insert the door key and turn it.
Remote Trunk Release (OPTION)
Press the yellow trunk release button located under the instrument panel on the driver's side.
Your automatic transaxle must be in P (Park).
Remember that your trunk can be opened at any time using the lock release. Be sure to lock your doors.

Convenience Net (OPTION)
Your vehicle may have a convenience net. You'll see it just inside the back wall of the trunk.
Put small loads, like grocery bags, behind the net. It can help keep them from falling over during sharp turns or quick starts and stops.
The net isn't for larger, heavier loads. Store them in the trunk as far forward as you can.
You can unhook the net so that it will lie flat when you're not using it.

4-Door Models:
To allow easier access to the trunk area when the convenience net is not being used, push the net down and hook it under the retaining screws as shown.
**Features & Controls**

**Glove Box**
To open, turn the knob clockwise. Push the lid down to close.

**New Vehicle "Break-in"**

**NOTICE**
Your modern Oldsmobile doesn't need an elaborate "break-in". But it will perform better in the long run if you follow these guidelines:

- Don't drive too fast or too slow—for the first 500 miles (804 km). Don’t make full-throttle starts.
- Avoid making hard stops for the first 200 miles (322 km) or so. During this time new brake linings aren't yet broken in. Hard stops with new linings can mean premature wear and earlier replacement. Follow these "break-in" guidelines every time you get new brake linings.

**Ignition Switch**
With the ignition key in the ignition switch, you can turn the switch to five positions:

- **Accessory**: An "on" position in which you can operate your radio and windshield wipers. Press in the ignition switch as you turn the top of it toward you.
- **Lock**: The only position in which you can remove the key. This locks your steering wheel, ignition and transaxle.
- **Off**: Unlocks the steering wheel, ignition, and transaxle, but does not send electrical power to any accessories. Use this position if your vehicle must be pushed or towed, but never try to push-start your vehicle.
**Run:** An "on" position to which the switch returns after you start your engine and release the switch. The switch stays in the Run position when the engine is running. But even when the engine is not running, you can use Run to operate your electrical power accessories, and to display some instrument panel warning lights.

**Start:** Starts the engine. When the engine starts, release the key. The ignition switch will return to Run for normal driving.

Note that even if the engine is not running, the positions Accessory and Run are "on" positions that allow you to operate your electrical accessories, such as the radio.

---

**NOTICE**

If your key seems stuck in Lock and you can't turn it, be sure it is all the way in. If it is, then turn the steering wheel left and right while you turn the key hard. But turn the key only with your hand. Using a tool to force it could break the key or the ignition switch. If none of this works, then your vehicle needs service.

---

**Starting Your Engine**

1. Move your shift lever to P (Park) or N (Neutral). Your engine won't start in any other position—that's a safety feature. To restart when you're already moving, use N (Neutral) only.

2. Don't push the accelerator pedal before starting your engine. In some other vehicles you might need to do this, but because of your vehicle's computer systems, you don't.
Starting Your Engine (cont.)

3. Turn the ignition to Start. When the engine starts, let go of the key. The idle speed will go down as your engine gets warm.

NOTICE

 Holding your key in Start for longer than 15 seconds at a time will drain your battery to be drained much sooner. And the excessive heat can damage your starter motor.

4. If your engine won't start (or starts but then stops), it could be flooded with too much gasoline. Try pushing your accelerator pedal all the way to the floor and holding it there as you hold the key in Start for about three seconds. If the vehicle starts briefly but then stops again, do the same thing, but this time keep the pedal down for five or six seconds. This clears the extra gasoline from the engine.

NOTICE

Your engine is designed to work with the electronics in your vehicle. If you add electrical parts or accessories, you could change the way the fuel injection system operates. Before adding electrical equipment, check with your dealer. If you don't, your engine might not perform properly.

If you ever have to have your vehicle towed, see the part of this manual that tells how to do it without damaging your vehicle. See the Index under Towing Your Vehicle.
Driving Through Deep Standing Water

**NOTICE**
If you drive too quickly through deep puddles or standing water, water can come in through your engine's air intake and badly damage your engine. If you can't avoid deep puddles or standing water, drive through them very slowly.

Engine Block Heater (OPTION)
In very cold weather, 0°F (-18°C) or colder, the engine block heater can help. You'll get easier starting and better fuel economy during engine warm-up.

**To Use the Block Heater:**
1. Turn off the engine.
2. Open the hood and unwrap the electrical cord.
3. Plug it into a normal, grounded 110-volt outlet.

CAUTION
Plugging the cord into an ungrounded outlet could cause an electrical shock. Also, the wrong kind of extension cord could overheat and cause a fire. You could be seriously injured. Plug the cord into a properly grounded three-prong 110-volt outlet. If the cord won't reach, use a heavy-duty three-prong extension cord rated for at least 15 amps.
Features & Controls

Engine Block Heater (CONT.)

NOTICE
After you've used the block heater, be sure to store the cord as it was before, to keep it away from moving engine parts. If you don't, it could be damaged.

How long should you keep the block heater plugged in? The answer depends on the weather, the kind of oil you have, and some other things. Instead of trying to list everything here, we ask that you contact an Oldsmobile dealer in the area where you'll be parking your vehicle. The dealer can give you the best advice for that particular area.

Shifting the Automatic Transaxle

Your automatic transaxle may have a shift lever located on the steering column or on the console between the seats. Both are shown above.

Maximum engine speed is limited on automatic transaxle vehicles when you're in D (Drive) or N (Neutral), to protect driveline components from improper operation.

There are six shift positions, seven if you have Overdrive. In this manual, these are referred to by the commonly used symbols in the right column below:

- Park P
- Reverse R
- Neutral N
- Overdrive ID
- Drive D
- Second 2
- First 1
Park
P (Park): This locks your front wheels. It's the best position to use when you start your engine because your vehicle can't move easily.

**CAUTION**

⚠️ It is dangerous to get out of your vehicle if the shift lever is not fully in P (Park) with the parking brake firmly set. Your vehicle can roll.
Don't leave your vehicle while the engine is running unless you have to. If you have left the engine running, the vehicle can move suddenly. You or others could be injured. To be sure your vehicle won't move, when you're on fairly level ground, always set your parking brake and move the shift lever to P (Park).
See the Index under Shifting into P (Park). If you are parking on a hill, or if you're pulling a trailer, also see the Index under Parking on Hills or Towing a Trailer.
Features & Controls

Reverse
R (Reverse): Use this gear to back up.

NOTICE
Shifting to R (Reverse) while your vehicle is moving forward could damage your transaxle. Shift to R only after your vehicle is stopped.

To rock your vehicle back and forth to get out of snow, ice or sand without damaging your transaxle, see the Index under If You’re Stuck: In Sand, Mud, Ice or Snow.

Neutral
N (Neutral): In this position, your engine doesn’t connect with the wheels. To restart when you’re already moving, use N (Neutral) only. Also, use N (Neutral) when your vehicle is being towed.

CAUTION
Shifting out of P (Park) or N (Neutral) while your engine is “racing” (running at high speed) is dangerous. Unless your foot is firmly on the brake pedal, your vehicle could move very rapidly. You could lose control and hit people or objects. Don’t shift out of P (Park) or N (Neutral) while your engine is racing.
Forward Gears

(Alternating Overdrive): If your automatic transaxle has Automatic Overdrive, this position is for normal driving. If you need more power for passing, and you're:

- Going less than 35 mph (56 km/h), push your accelerator pedal about halfway down.
- Going about 35 mph (56 km/h) or more, push the accelerator all the way down. You'll shift down to the next gear and have more power.

NOTICE

Damage to your transaxle caused by shifting out of P (Park) or N (Neutral) with the engine running isn't covered by your warranty.

NOTICE

This NOTICE applies only if you have an automatic Overdrive transaxle. If your vehicle is so equipped and it seems to start up rather slowly, or if it seems not to shift gears as you go faster, something may be wrong with a transaxle system sensor. If you drive very far that way, your vehicle can be damaged. So, if this happens, have your vehicle serviced right away. Until then, you can use 2 (Second Gear) when you are driving less than 35 mph (56 km/h), and 0 (Overdrive) for higher speeds.
Forward Gears (CONT.)

**D (Third Gear):** If your automatic transaxle does not have Overdrive, this position is for normal driving, at all speeds, in most street and highway situations.

If your automatic transaxle has Overdrive, D is like [D], but you never go into Overdrive.

Here are some times you might choose D instead of [D]:
- When driving on hilly, winding roads.
- When towing a trailer, so there is less shifting between gears.
- When going down a steep hill.

**2 (Second Gear):** This position gives you more power but lower fuel economy. You can use 2 on hills. It can help control your speed as you go down steep mountain roads, but then you would also want to use your brakes off and on.

**1 (First Gear):** This position gives you even more power (but lower fuel economy) than 2. You can use it on very steep hills, or in deep snow or mud. If the selector lever is put in 1, the transaxle won't shift into first gear until the vehicle is going slowly enough.

### NOTICE

**Don't drive in 2 (Second Gear) for more than 5 miles (8 km), or at speeds over 35 mph (56 km/h), or you can damage your transaxle.**

**Don't shift into 2 unless you are going slower than 25 mph (40 km/h), or you can damage your engine.**

### NOTICE

**If your front wheels can't rotate, don't try to drive. This might happen if you were stuck in very deep mud or stuck in a bad spot against a solid object. You could damage your transaxle.**

**Also, if you stop when going uphill, don't hold your vehicle there with only the accelerator pedal. This could overheat and damage the transaxle. Use your brakes or shift into P (Park) to hold your vehicle in position on a hill.**
**Pump-to-Set Parking Brake**

The parking brake uses the brakes on the rear wheels.

**To Set the Parking Brake:**
Hold the regular brake pedal down with your right foot. Pump your parking brake pedal several times with your left foot until the pedal feels firm. If the ignition is on, the brake system warning light will come on.

Over time, more pumps may be needed to set the parking brake firmly. If it ever takes more than two full pumps, have the brake system adjusted by your dealer.

**To Release the Parking Brake:**
Hold the regular brake pedal down. Pull the BRAKE RELEASE lever.

**NOTICE**
Driving with the parking brake on can cause your rear brakes to overheat. You may have to replace them, and you could also damage other parts of your vehicle.

If You are on a Hill:
See the index under Parking on Hills. That section shows how to turn your front wheels.

If You are Towing a Trailer and are Parking on any Hill:
See the index under Towing a Trailer. That section shows what to do first to keep the trailer from moving.
CAUTION
It is dangerous to get out of your vehicle if the shift lever is not fully in P (Park) with the parking brake firmly set. Your vehicle can roll. If you have left the engine running, the vehicle can move suddenly. You or others could be injured. To be sure your vehicle won't move, when you're on fairly level ground, use the steps that follow. If you are parking on a hill, or if you're pulling a trailer, also see the index under Parking on Hills or Towing a Trailer.

1. Hold the brake pedal down with your right foot and set the parking brake.
2. Move the shift lever into P (Park) position like this:
   - Pull the lever towards you.
   - Move the lever up as far as it will go.
3. Move the ignition key to Lock.
4. Remove the key and take it with you. If you can walk away from your vehicle with the ignition key in your hand, your vehicle is in P (Park).
Shifting into P (Park)—Console Shift

**CAUTION**

It is dangerous to get out of your vehicle if the shift lever is not fully in P (Park) with the parking brake firmly set. Your vehicle can roll. If you have left the engine running, the vehicle can move suddenly. You or others could be injured. To be sure your vehicle won’t move, when you’re on fairly level ground, use the steps that follow. If you are parking on a hill, or if you’re pulling a trailer, also see the Index under Parking on Hills or Towing a Trailer.

1. Hold the brake pedal down with your right foot and set the parking brake.

2. Move the shift lever into the P (Park) position like this:
   - Hold in the button on the lever, and push the lever all the way toward the front of your vehicle.

3. Move the ignition key to Lock.
4. Remove the key and take it with you. If you can walk away from your vehicle with the ignition key in your hand, your vehicle is in P (Park).

Leaving Your Vehicle With the Engine Running

**CAUTION**

It is dangerous to leave your vehicle with the engine running. Your vehicle could move suddenly if the shift lever is not fully in P (Park) with the parking brake firmly set. And, if you leave the vehicle with the engine running, it could overheat and even catch fire. You or others could be injured. Don’t leave your vehicle with the engine running unless you have to.
Parking Over Things That Burn

CAUTION

Things that can burn could touch hot exhaust parts under your vehicle and ignite. Don't park over papers, leaves, dry grass or other things that can burn.

CAUTION

Engine Exhaust

Engine exhaust can kill. It contains the gas carbon monoxide (CO), which you can't see or smell. It can cause unconsciousness and death. You might have exhaust coming in if:

- Your exhaust system sounds strange or difficult.
- Your vehicle gets noisy underneath.
- Your vehicle was damaged in a collision.
- Your vehicle was damaged when driving over high points on the road or over road debris.
- Repairs weren't done correctly.
- Your vehicle or exhaust system had been modified improperly.

If you ever suspect exhaust is coming into your vehicle:

- Drive it only with all the windows down to blow out any CO; and
- Have it fixed immediately.

Leaving Your Vehicle With the Engine Running (CONT.)

If you have to leave your vehicle with the engine running, be sure your vehicle is in P (Park) and your parking brake is firmly set before you leave it. After you've moved the shift lever into the P (Park) position, hold the regular brake pedal down. Then, see if you can move the shift lever away from P (Park) without first pulling it toward you (or, if you have the console shift lever, without first pushing the button). If you can, it means that the shift lever wasn't fully locked into P (Park).
Running Your Engine While You’re Parked

It's better not to park with the engine running. But if you ever have to, here are some things to know.

**CAUTION**

- Idling the engine with the air system control OFF could allow dangerous exhaust into your vehicle (see the earlier CAUTION under Engine Exhaust).

- Also, idling in a closed-in place can let deadly carbon monoxide (CO) into your vehicle even if the fan switch is at the highest setting. One place this can happen is a garage. Exhaust—with CO—can come in easily. NEVER park in a garage with the engine running.

- Another closed-in place can be a Blizzard. (See the Index under Blizzard.)

- It can be dangerous to get out of your vehicle if the shift lever is not fully in P (Park) with the parking brake firmly set. Your vehicle can roll. Don’t leave your vehicle when the engine is running unless you have to. If you've left the engine running, the vehicle can move suddenly. You or others could be injured.

- To be sure your vehicle won’t move, even when you're on fairly level ground, always set your parking brake and move the shift lever to P (Park).

- If you are parking on a hill, or if you're pulling a trailer, also see the Index under Parking on Hills or Towing a Trailer.

---

**Horn**

You can sound the horn by pressing the horn symbols on your steering wheel.
Features & Controls

Tilt Steering Wheel (OPTION)
A tilt steering wheel allows you to adjust the steering wheel before you drive.
You can also raise it to the highest level to give your legs more room when you exit and enter the vehicle.
To tilt the wheel, hold the steering wheel and pull the lever. Move the steering wheel to a comfortable level, then release the lever to lock the wheel in place.

Windows
On a vehicle with manual windows, use the window crank to open and close each window.

Power Windows (OPTION)
With power windows, switches on the driver's armrest control each of the windows when the ignition is on. In addition, each passenger door has a control switch for its own window.
The driver's window switch has a Power Auto Down feature. This switch is labeled AUTO. The driver's window can be opened a small amount by tapping the rear of the switch.
To stop the window while it is lowering, press the front of the AUTO switch, then release. To raise the window, press and hold the front of the AUTO switch.
Passenger Lockout Switch
On 4-door models, this switch disables all passenger power windows. Push the switch to LOCK to disable the window switches on all doors except the driver's. Push the switch to NORMAL for normal power window operation.

**Turn Signal/Headlight Beam Lever**
The lever on the left side of the steering column includes your:
- Turn Signal and Lane Change Indicator
- Cruise Control (Option)
- Windshield Wipers
- Windshield Washer
- Headlight High-Low Beam
- Flash-to-Pass

**Turn Signal and Lane Change Indicator**
The turn signal has two upward (for Right) and two downward (for Left) positions. These positions allow you to signal a turn or a lane change.

To Signal a Turn:
Move the lever all the way up or down. When the turn is finished, the lever will return automatically.
Turn Signal and Lane Change Indicator (CONT.)

A green arrow on the instrument panel will flash in the direction of the turn or lane change.

To signal a lane change, just raise or lower the lever until the green arrow starts to flash. Hold it there until you complete your lane change. The lever will return by itself when you release it.

As you signal a turn or a lane change, if the arrows don’t flash but just stay on, a signal bulb may be burned out and other drivers won’t see your turn signal.

If a bulb is burned out, replace it to help avoid an accident. If the green arrows don’t go on at all when you signal a turn, check the fuse (see the Index under Fuses & Circuit Breakers) and for burned-out bulbs.

A warning chime will remind you if you have left your turn signal on for more than 1/2 mile (.8 km) of driving.

— Cruise Control (OPTION)

With cruise control, you can maintain a speed of about 25 mph (40 km/h) or more without keeping your foot on the accelerator. This can really help on long trips.

Cruise control does not work at speeds below about 25 mph (40 km/h).

When you apply your brakes, the cruise control shuts off.
Cruise control can be dangerous where you can't drive safely at a steady speed. So, don't use your cruise control on winding roads or in heavy traffic.

Cruise control can be dangerous on slippery roads. On such roads, fast changes in tire traction can cause needless wheel spinning, and you could lose control. Don't use cruise control on slippery roads.

To Set Cruise Control

1. Move the cruise control switch to ON.
2. Get up to the speed you want.
3. Push in the SET button at the end of the lever and release it.
4. Take your foot off the accelerator pedal.

CAUTION
- Cruise control can be dangerous where you can't drive safely at a steady speed. So, don't use your cruise control on winding roads or in heavy traffic.
- Cruise control can be dangerous on slippery roads. On such roads, fast changes in tire traction can cause needless wheel spinning, and you could lose control. Don't use cruise control on slippery roads.
To Resume a Set Speed

Suppose you set your cruise control at a desired speed and then you apply the brake. This, of course, shuts off the cruise control. But you don’t need to reset it. Once you’re going about 25 mph (40 km/h) or more, you can move the cruise control switch from ON to R/A (which stands for Resume/Accelerate) for about half a second. You’ll go right back up to your chosen speed and stay there.

CAUTION

If you hold the switch at R/A longer than half a second, the vehicle will keep going faster until you release the switch or apply the brake. You could be startled and even lose control. So, unless you want to go faster, don’t hold the switch at R/A.

To Increase Speed While Using Cruise Control

There are two ways to go to a higher speed. Here’s the first:

1. Use the accelerator pedal to get to the higher speed.
2. Push the button at the end of the lever, then release the button and the accelerator pedal.

You’ll now cruise at the higher speed. Here’s the second way to go to a higher speed:

1. Move the cruise switch from ON to R/A.
   Hold it there until you get up to the speed you want, and then release the switch.
2. To increase your speed in very small amounts, move the switch to R/A for less than half a second and then release it. Each time you do this, your vehicle will go about 1 mph (1.6 km/h) faster.
To Reduce Speed While Using Cruise Control
There are two ways to reduce your speed while using cruise control:
- Push in the button at the end of the lever until you reach the lower speed you want, then release it.
- To slow down in very small amounts, push the button for less than half a second. Each time you do this, you'll go 1 mph (1.6 km/h) slower.

Passing Another Vehicle While Using Cruise Control
Use the accelerator pedal to increase your speed. When you take your foot off the pedal, your vehicle will slow down to the cruise control speed you set earlier.

Using Cruise Control on Hills
How well your cruise control will work on hills depends upon your speed, load, and the steepness of the hills. When going up steep hills, you may have to step on the accelerator pedal to maintain your speed. When going downhill, you may have to brake or shift to a lower gear to keep your speed down. Of course, applying the brake takes you out of cruise control. Many drivers find this to be too much trouble and don't use cruise control on steep hills.
Features & Controls

To Get Out of Cruise Control
There are two ways to turn off the cruise control:
- Step lightly on the brake pedal; OR
- Move the cruise switch to OFF.

To Erase Cruise Speed Memory
When you turn off the cruise control or the ignition, your cruise control set speed memory is erased.

Windshield Wipers
You control the windshield wipers by turning the band marked WIPER.
For a single wiping cycle, turn the band to MIST. Hold it there until the wipers start, then let go. The wipers will stop after one cycle. If you want more cycles, hold the band on MIST longer.
For steady wiping at low speed, turn the band away from you to the LO position.
For high speed wiping, turn the band further, to HI. To stop the wipers, move the band to OFF.

CAUTION
- Damaged wiper blades may prevent you from seeing well enough to drive safely. To avoid damage, be sure to clear ice and snow from the wiper blades before using them. If they're frozen to the windshield, carefully loosen or thaw them. If your blades do become damaged, get new blades or blade inserts.
- Heavy snow or ice can overload your wipers. A circuit breaker will stop them until the motor cools. Clear away snow or ice to prevent an overload.
Pulse Windshield Wipers (Option)
You can set the wiper speed for a long or short delay between wipes. This can be very useful in light rain or snow.
Turn the knob to choose the delay time. The closer to LO, the shorter the delay.

Windshield Washer
At the top of the turn signal/headlight beam lever there's a paddle with the word PUSH on it. To spray washer fluid on the windshield, push the paddle.
If you have the standard wipers, the wipers will keep going in LO until you turn the wiper control to OFF.
If you have the Pulse option, the wipers will clear the window and then either stop or return to your preset speed.

CAUTION
- Driving without washer fluid can be dangerous. A bad mud splash can block your vision. You could hit another vehicle or go off the road. Check your washer fluid level often.
- In freezing weather, don't use your washer until the windshield is warmed. Otherwise the washer fluid can form ice on the windshield, blocking your vision.
**NOTICE**

- When using concentrated washer fluid, follow the manufacturer’s instructions for adding water.
- Don’t mix water with ready-to-use washer fluid. Water can cause the solution to freeze and damage your washer fluid tank and other parts of the washer system. Also, water doesn’t clean as well as washer fluid.
- Fill your washer fluid tank only ¾ full when it’s very cold. This allows for expansion, which could damage the tank if it is completely full.
- Don’t use radiator antifreeze in your windshield washer. It can damage your washer system and paint.

**Headlights**

The main light controls are on the left side of the instrument panel.

Push the switch in halfway to turn on your:
- Parking Lights
- Running Lights
- Taillights
- Instrument Panel Lights

Push the switch in all the way to turn on the headlights, together with the:
- Parking Lights
- Running Lights
- Taillights
- Instrument Panel Lights

Push the switch again to turn the lights off.

A green indicator light in the center of the switch will come on when you start the engine. This helps you locate the switch at night.
Operation of Lights
Although your vehicle’s lighting system (headlamps, parking lamps, fog lamps, side marker lamps and tail lamps) meets all applicable federal lighting requirements, certain states and provinces may apply their own lighting regulations that may require special attention before you operate these lamps. For example, some jurisdictions may require that you operate your lower beam lamps with fog lamps at all times or that headlamps be turned on whenever you must use your windshield wipers. In addition, most jurisdictions prohibit driving solely with parking lamps, especially at dawn or dusk. It is recommended that you check with your own state or provincial highway authority for applicable lighting regulations.

Lights On Reminder
If you open the door while leaving the lights on, you will hear a warning tone.

Daytime Running Lights (CANADA ONLY)
The Canadian Federal Government has decided that “Daytime Running Lights” (DRL) are a useful feature, in that DRL can make your vehicle more visible to pedestrians and other drivers during daylight hours. DRL are required on new vehicles sold in Canada.

Your DRL work with a light sensor on top of the instrument panel. Don’t cover it up.

The low-beam headlights will come on at reduced brightness in daylight when:
• The ignition is on
• The headlight switch is off, and
• The parking brake is released.
Daytime Running Lights (cont.)
At dusk, the exterior lights will come on automatically and the low beams will change to full brightness. At dawn, the exterior lights will go out and the low beams will change to the reduced brightness of DRL (if the headlight switch is off).
Of course, you may still turn on the headlights any time you need to.
To idle your vehicle with the DRL on, set the parking brake while the ignition is in the Off or Lock position. Then start the vehicle. The DRL will stay on until you release the parking brake.

Headlight High-Low Beam Changer
To change the headlights from low beams to high or high to low, pull the turn signal/headlight beam lever all the way toward you. Then release it.
When the high beams are on, a blue light on the instrument panel also will be on.

Flash-to-Pass
Flash-to-pass lets you use your high beam headlights to signal a driver in front of you that you want to pass.
To use it, pull the turn signal/headlight beam lever toward you.
If Your Headlights are Off:
Your high beam headlights will turn on. They'll stay on as long as you hold the lever there. Release the lever to turn them off.
If Your Headlights are On:
No flash-to-pass. Use the lever to change between high and low beams, as explained under Headlight High-Low Beam Changer earlier in this section.
If You Have Fog Lights:
They go off whenever the high beams are on. When the high beams go off, the fog lights will come on again, if the fog light switch is on.
**Instrument Panel Intensity Control**

You can brighten or dim the instrument panel lights by sliding the control knob up or down. If you slide the knob all the way up to INT, your courtesy or interior lights will come on. To turn instrument panel lights on to full intensity with the headlights on, slide the control knob to MAX.

**Fog Lights (OPTION)**

Use your fog lights for better vision in foggy or misty conditions. To turn fog lights on, push the switch. Push the switch again to turn the fog lights off.

When using fog lights, the parking lights or low beam headlights must be on. The fog lights will go off whenever the high beam headlights come on. When the high beams go off, the fog lights will come on again.

**Front Reading/Map Lights (OPTION)**

These lights are part of the rearview mirror. They go on when you open the doors. When the doors are closed, turn them on and off with the switch. To avoid draining your vehicle's power, be sure to turn off all front and rear reading lights when leaving your vehicle.
Features & Controls

**Dome Reading Lights (OPTION)**
These lights are part of your dome light. Press the switch nearest the light you want on. Press the switch again to turn the light off.

**Rear Reading Lights (OPTION)**
These lights go on when you open the doors. To turn on the reading lights when the doors are closed, push the button in. Push the button again to turn the light off.

**Inside Manual Day/Night Rearview Mirror**
To reduce glare from lights behind you, pull the lever toward you to the night position.
Convex Outside Mirror
Your right side mirror is convex. A convex mirror's surface is curved so you can see more from the driver's seat.

**CAUTION**

⚠️ If you aren't used to a convex mirror, you can hit another vehicle. A convex mirror can make things (like other vehicles) look farther away than they really are. If you cut too sharply into the right lane, you could hit a vehicle on your right. Check your inside mirror or glance over your shoulder before changing lanes.

Manual Adjust Mirror
The passenger side outside mirror should be adjusted by hand so that you just see the side of your vehicle when you are sitting in a comfortable driving position.

Manual Remote Control Mirror
The driver's side outside mirror can be adjusted with the control lever on the armrest so that you just see the side of your vehicle when you are sitting in a comfortable driving position.
Features & Controls

Power Remote Control Mirrors (OPTION)
A selector switch on the driver’s door armrest controls both outside rearview mirrors. Move the switch to L to select the driver’s side rearview mirror, or to R to select the passenger side rearview mirror. Then press the control pad to adjust each mirror so that you just see the side of your vehicle when you are sitting in a comfortable driving position. To lock the controls, leave the selector switch in the middle position.

Sun Visors
To block out glare, you can swing down the visors. You can also remove them from the center mount and swing them to the side.

Visor Vanity Mirrors
Standard Mirror: Open the cover to expose the vanity mirror.
Lighted Mirrors (Option): If your vehicle has the optional lighted vanity mirrors, the lights come on when you open the cover. These can even be used for reading.
Fold-Down Storage Compartment (OPTION)
To open, fold down the armrest console, press the latch on the underside and pull up.
In addition to storage space, you will find:
- A fold-out cup holder.
- A coin holder.
- Cassette tape storage.
To close, push down on the lid.

Cassette Tape Holder/Storage Compartment and Cup Holder (OPTION)
You may store cassette tapes in the slots at the bottom. To open, press the latch on the underside of the center armrest console and pull up.
To close, push down on the lid.
You also have a fold-out cup holder.

Coin Holder (OPTION)
Use your coin holder to store nickels, dimes and quarters. It lifts out for loading coins or cleaning.
Features & Controls

Rear Seat Console (OPTION)
To use the rear seat storage compartment and cup holders, pull the strap on the back of the console forward.

Trunk Access Panel
If you have split rear seats, you may have a trunk access panel for storing long objects like skis. Pull your rear armrest down using the strap. Then pull the latch on the trunk access panel towards you to open the panel.
To close the access panel lift the latch.

Ashtrays and Lighter
To clean the ashtrays, open them fully and lift out the ashtray by pulling on the snuffer.
To use the lighter, just push it in all the way and let go. When it's ready, it will pop back by itself.
NOTICE
Don't hold a cigarette lighter in with your hand while it is heating. If you do, it won't be able to back away from the heating element when it's ready. That can make it overheat, damaging the lighter and the heating element.

NOTICE
Don't put papers and other things that burn into your ashtray. If you do, cigarettes or other smoking materials could set them on fire, causing damage.

Easy-Open Ashtray (OPTION)
Push in on the front of the ashtray and release; it will slide open. To close, push it in again.
Sunroof (Option)
Your sunroof provides an airy, spacious feel to your vehicle's interior and can also increase ventilation. It includes a sliding glass panel and a sliding sunshade. The control switch will work only when the ignition is on.

To Open the Sunroof:
Press the rear of the switch to open the glass panel and sunshade. Let go of the switch to stop the panel in any position.

To Close the Sunroof:
Press the front of the switch to close the glass panel. The sunshade can only be closed by hand.

The sunroof glass panel cannot be opened or closed if your Oldsmobile has an electrical failure.

To Open the Sunroof Rear Vent:
Press the front of the switch when the sunroof is closed. Open the sunshade by hand.

To Close the Sunroof Rear Vent:
Press the rear of the switch.
**Luggage Carrier (OPTION)**

If you have the optional luggage carrier, you can load things on the deck lid of your vehicle.

The luggage carrier has slats attached to the deck lid, a rear rail, and tiedowns.

---

**NOTICE**

Loading cargo that weighs more than 50 pounds (25 kg) on the luggage carrier may damage your vehicle. When you carry large things, never let them hang over the rear or the sides of your vehicle. Load your cargo so that it rests on the slats and does not scratch or damage the vehicle. Put the cargo against the rear rail and fasten it securely to the luggage carrier.

Don’t exceed the maximum vehicle capacity when loading your Oldsmobile. For more information on vehicle capacity and loading, see the Index under Loading Your Vehicle.

To prevent damage or loss of cargo as you’re driving, check now and then to make sure the luggage carrier and cargo are still securely fastened.
The Instrument Panel—
Your Information System

Your instrument panel is designed to let you know at a glance how your vehicle is running. You'll know how fast you're going, how much fuel you're using, and many other things you'll need to drive safely and economically.

The main components of your instrument panel are:

1. Turn Signal/Headlight Beam Lever
2. Tilt Steering Wheel Lever
3. Indicator Lights
4. Instrument Cluster
5. Warning Lights
6. Gearshift Lever
7. Audio System
8. Glove Box/Fuse Panel
9. Vents
10. Vents
11. Climate Control/Rear Window Defogger
12. Ashtray and Lighter
13. Vents
14. Ignition Switch
15. Hazard Warning Flashers Switch
16. Horn
17. Remote Trunk Release (Option)
18. Brake Release
19. Hood Release (on floor by driver's door)
20. Light Controls
Features & Controls

*Instrument Panel Clusters*

Your Oldsmobile is equipped with one of these instrument panel clusters, which includes indicator warning lights and gauges that are explained on the following pages. Be sure to read about those that apply to the instrument panel cluster for your Oldsmobile.

**ELECTRONIC CLUSTER**

**ANALOG CLUSTER**
Warning Lights, Gages and Indicators

This section describes the warning lights and gages that may be on your vehicle. The pictures will help you locate them. Warning lights and gages can signal that something is wrong before it becomes serious enough to cause an expensive repair or replacement. Paying attention to your warning lights and gages could also save you or others from injury. Warning lights go on when there may be or is a problem with one of your vehicle’s functions. As you will see in the details on the next few pages, some warning lights come on briefly when you turn the ignition key just to let you know they’re working. If you are familiar with this section, you should not be alarmed when this happens. Gages can indicate when there may be or is a problem with one of your vehicle’s functions. Often gages and warning lights work together to let you know when there’s a problem with your vehicle.

When one of the warning lights comes on and stays on when you are driving, or when one of the gages shows there may be a problem, check the section that tells you what to do about it. Please follow the manual’s advice. Waiting to do repairs can be costly—and even dangerous. So please get to know your warning lights and gages. They’re a big help.
Features & Controls

**Speedometer (ELECTRONIC CLUSTER)**

Press the E/M (English/Metric) button on the left side of the instrument cluster to switch the display between miles per hour (mph) and kilometers per hour (km/h).

**Odometer and Trip Odometer (ELECTRONIC CLUSTER)**

Your odometer shows how far your vehicle has been driven, in either miles (used in the U.S.) or in kilometers (used in Canada). Your trip odometer tells how far you have driven since you last reset it. To set it to zero, display the trip odometer by pressing the SELECT button, then press the RESET button. Both buttons are located on the right side of the instrument cluster.

Your Oldsmobile has a tamper resistant odometer. The odometer will read ERROR if someone has tampered with it.

You may wonder what happens if your vehicle needs a new odometer installed. If the new one can be set to the mileage total of the old odometer, then it must be. But if it can't, then it's set at zero and a label must be put on the driver's door to show the old mileage reading when the new odometer was installed.
Your speedometer lets you see your speed in both miles per hour (mph) and kilometers per hour (km/h).

Your odometer shows how far your vehicle has been driven, in either miles (used in the U.S.) or in kilometers (used in Canada). Your trip odometer tells how far you have driven since you last reset it. To set it to zero, press the RESET button located next to the trip odometer on the right side of the instrument panel.

Your Oldsmobile has a tamper resistant odometer. If you see silver lines between the numbers, you'll know someone has probably tampered with it and the numbers may not be true.

You may wonder what happens if your vehicle needs a new odometer installed. If the new one can be set to the mileage total of the old odometer, then it must be. But if it can't, then it's set to zero and a label must be put on the driver's door to show the old mileage reading when the new odometer was installed.
Features & Controls

Tachometer (ANALOG CLUSTER)
The tachometer displays the engine speed in revolutions per minute (rpm).

**NOTICE**
Do not operate the engine with the tachometer in the red area, or engine damage may occur.

Fuel Gage
You have one of the fuel gauges shown. The fuel gage tells you about how much fuel you have left, when the ignition is on. When the indicator reads E (Empty), you still have a little fuel left, but you should get more soon.

Here are three things that some owners ask about. None of these show a problem with your fuel gage:
- At the gas station, with your ignition on, the gas pump shuts off before the gage reads F (Full).
- It takes a little more or less fuel to fill up than the gage indicated. For example, the gage may have indicated the tank was half full, but it actually took a little more or less than half the tank's capacity to fill the tank.
- The gage moves a little when you turn a corner or speed up.

For your fuel tank capacity, see Service Station Information on the last page of this manual.
**Low Fuel Warning Light**  
*(ELECTRONIC CLUSTER)*

If your fuel is low, a light will come on. The warning will not go off until you add fuel. It will also come on for a few seconds when you first turn on the ignition as a check to show you it is working. If it doesn’t come on then, have it fixed.

---

**Engine Coolant Temperature Warning Light**  
*(ELECTRONIC CLUSTER)*

This light tells you that your engine coolant has overheated or your radiator cooling fan is not working. If you have been operating your vehicle under normal driving conditions, you should pull off the road, stop your vehicle and turn the engine off as soon as possible.

**HOT COOLANT CAN BURN YOU BADLY!**

In Problems on the Road, this manual shows what to do. See the Index under Engine Overheating.

---

**Engine Coolant Temperature Gage**  
*(ANALOG CLUSTER)*

You have a gage that shows the engine coolant temperature. If the gage pointer moves into the red area, your engine is too hot!

That reading means the same thing as the warning light. It means that your engine coolant has overheated. If you have been operating your vehicle under normal driving conditions, you should pull off the road, stop your vehicle and turn off the engine as soon as possible.

**HOT COOLANT CAN BURN YOU BADLY!**

In Problems on the Road, this manual shows what to do. See the Index under Engine Overheating.
Features & Controls

Low Coolant Warning Light
If this light comes on, your system is low on coolant and the engine may overheat.
See the Index under Engine Coolant and have your vehicle serviced as soon as you can.

Oil Warning Light (ELECTRONIC CLUSTER)
If you have a problem with your oil, this light may stay on after you start your engine, or come on when you are driving. This indicates that oil is not going through your engine quickly enough to keep it lubricated. The engine could be low on oil, or could have some other oil problem. Have it fixed right away.

The oil light could also come on in these other situations:
- When the ignition is on but the engine is not running, the light will come on as a test to show you it is working, but the light will go out when you turn the ignition to Start. If it doesn't come on with the ignition on, you may have a problem with the fuse or bulb. Have it fixed right away.
- Sometimes when the engine is idling at a stop, the light may blink on and off. This is normal.
- If you make a hard stop, the light may come on for a moment. This is normal.
**CAUTION**

Don't keep driving if the oil pressure is low. If you do, your engine can become so hot that it catches fire. You or others could be burned. Check your oil as soon as possible and have your vehicle serviced.

---

**Oil Pressure Indicator (ANALOG CLUSTER)**

This indicator tells you if there could be a problem with your engine oil pressure. The pointer should be above the red zone when the engine is running. Readings in the red area tell you that the engine is low on oil, or that you might have some other oil problem. See the index under Engine Oil.

---

**NOTICE**

Damage to your engine from neglected oil problems can be costly and is not covered by your warranty.

---

**CAUTION**

Don't keep driving if the oil pressure is low. If you do, your engine can become so hot that it catches fire. You or others could be burned. Check your oil as soon as possible and have your vehicle serviced.
Battery Warning Light (ELECTRONIC CLUSTER)
The charging system light will come on briefly when you turn on the ignition as a check to show you it is working. Then it should go out. If it stays on, or comes on while you are driving, you may have a problem with the electrical charging system. It could indicate that you have a loose generator drive belt or another electrical problem. Have it checked right away. Driving while this light is on could drain your battery.

If you must drive a short distance with the light on, be certain to turn off all your accessories, such as the radio and air conditioner.

Voltmeter (ANALOG CLUSTER)
When the engine is running, the gage shows the condition of the charging system. Readings between the red warning zones indicate the normal operating range.

Readings in either red warning zone indicate a possible problem in the electrical system. Have your vehicle serviced immediately.

When your engine is not running, but the ignition is on (in the Run position), the gage shows your battery’s state of charge.

Brake System Warning Light
Your Oldsmobile’s hydraulic brake system is divided into two parts. If one part isn’t working, the other part can still work and stop you. For good braking, though, you need both parts working well. If the warning light goes on, there could be a brake problem.

Have your brake system inspected right away.

This light should come on as you start the vehicle. If it doesn’t come on then, have it fixed so it will be ready to warn you if there’s a problem.

This light will also come on when you set your parking brake, and will stay on if your parking brake doesn’t release fully. If it stays on after your parking
brake is fully released, it means you have a brake problem. If the light comes on while driving, pull off the road and stop carefully. You may notice that the pedal is harder to push. Or, the pedal may go closer to the floor. It may take longer to stop. If the light is still on, have the vehicle towed for service. (See the Index under Towing Your Oldsmobile.)

**CAUTION**

Your brake system may not be working properly if the brake warning light is on. Driving with the brake warning light on can lead to an accident. If the light is still on after you've pulled off the road and stopped carefully, have the vehicle towed for service.

---

**Anti-Lock Brake System Warning Light (Option)**

With anti-lock, this light will go on when you start your engine and it will stay on for three seconds. That's normal. If the light doesn't come on, have it fixed so it will be ready to warn you if there is a problem.

If the light stays on or comes on while you're driving, stop as soon as possible and turn the key off. Then start the engine to reset the system. If the light still stays on, or comes on again while you're driving, your Oldsmobile needs service. Unless the regular brake system warning light is also on, you will still have brakes, but not anti-lock brakes. If the regular brake system warning light
Anti-Lock Brake System Warning Light (cont.)

is also on, see Brake System Warning Light earlier in this section.

If the anti-lock brake system warning light ever flashes, your anti-lock brake system is still working but needs service as soon as possible.

Malfunction Indicator Lamp (Service Engine Soon Light)

A computer monitors operation of your fuel, ignition and emission control systems. This light should come on when the ignition is on, but the engine is not running, as a check to show you it is working. If it does not come on at all, have it fixed right away. If it stays on, or it comes on while you are driving, the computer is indicating that you have a problem. You should take your vehicle in for service soon.

NOTICE

If you keep driving your vehicle with this light on, after a while the emission controls won't work as well, your fuel economy won't be as good and your engine may not run as smoothly. This could lead to costly repairs not covered by your warranty.
**Check Gages Light (ANALOG CLUSTER)**

If you have the analog cluster, you have a CHECK GAGES light. When this light comes on, it means one of these four things:

- You have approximately 3 gallons (12 L) or less of fuel remaining in your tank. Check your fuel gage.
- Your oil pressure is low. Check your oil pressure indicator.
- Your engine is too hot. Check your coolant temperature gage.
- There is a problem with the charging system.

**Head-Up Display (OPTION)**

If you have the optional Head-Up Display (HUD), you can see the speedometer reading, in English or metric units, displayed "through" the windshield. The HUD also shows:

- Turn signal indicator lights.
- A high beam indicator symbol.
- A CHECK GAGES message. (For low oil pressure, high/coolant temperature, high or low battery voltage, and low fuel.)

HUD shows these lights when they are lit on the instrument panel.

When you sit straight in your seat, the HUD image will appear slightly to the right.

When the ignition key is turned to Run, all possible HUD images will come on and look like this. Then the Head-Up Display will operate normally.
Head-Up Display (CONT.)

CAUTION

If you never look at your instrument panel, you may not see something important, such as a warning light. So be sure to scan your displays and controls and the driving environment just as you would in a vehicle without HUD.

NOTICE

Although the HUD image appears to be near the front of the vehicle, do not use it as a parking aid. The HUD was not designed for that purpose. If you try to use it that way, such as in a parking lot, you may misjudge distance and run into something.

To adjust the HUD so you can see it properly:
1. Start your engine and slide the HUD dimmer control (located below the climate controls) all the way to MAX.

The brightness of the HUD image is determined by whether the headlight switch is on or off, and where you have set the HUD dimmer control.
2. Adjust the seat, if necessary, before setting the height control. Rotate the HUD image height control all the way up, raising the image as far as possible. Then rotate the HUD image height control downward so the image is as low as possible but in full view.

3. Slide the dimmer control toward OFF until the HUD image is no brighter than necessary. To turn the HUD off, slide the HUD dimmer control to OFF.

If the sun comes out, or it becomes cloudy, or if you turn on your headlights, you may need to adjust the HUD’s brightness using the HUD dimmer control. Polarizing sunglasses could make the HUD image harder to see.

**CAUTION**

If the HUD image is too bright, or too high in your field of view, it may take you more time to see things you need to see when it’s dark outside. Be sure to keep the HUD image dim and placed low in your field of view.
Head-Up Display (cont.)
Pushing the ENG/MET rocker switch on the center console will switch the HUD speedometer from English (conventional) to metric units, or back again.
Some vehicles may not be equipped with the ENG/MET switch.

Care of the Head-Up Display
Clean the inside of the windshield as needed to remove any dirt or film that reduces the sharpness or clarity of the HUD image.
To Clean the HUD:
Spray household glass cleaner on a soft, clean cloth. Wipe the HUD lens gently, then dry it. Do not spray cleaner directly on the lens, because the cleaner fluid could leak inside the unit if you do.

If You Can’t See the HUD Image When the Ignition is On:
• Is anything covering the HUD unit?
• Is the HUD dimmer control close enough to MAX?
• Is the HUD image adjusted to the proper height?
• Still no HUD image? Check the fuse in the CLUST position in the glove box fuse panel. See the Index under Fuses & Circuit Breakers.
If the HUD Image is Not Clear:

- It could be too bright. Move the HUD dimmer control closer to OFF.
- You may need to clean the windshield and HUD lens.

Your windshield is part of the HUD system. If you ever have to have a new windshield, be sure to get one designed for HUD. If you don’t, the HUD image may look blurred and out of focus.
In this part you’ll find out how to operate the comfort control systems and audio systems offered with your Oldsmobile. Be sure to read about the particular system supplied with your vehicle.
Climate Control
The air conditioner and heater work best if you keep your windows closed while using them. Your vehicle also has the flow-through ventilation system described later in this section.

OFF: Press to turn the blower off. Some air will still come from the outlets at the floor. Press any function button to turn the system on.

Temperature Control Lever: This lever changes the temperature of the air coming through the system. The higher the lever setting, the warmer the air.

**: Selects the force of air you want. Press LO to lower the fan speed, HI to raise it.

Air Conditioning
On very hot days, open the windows long enough to let hot inside air escape. This reduces the time it takes for your vehicle to cool down, which should help fuel economy.

There are three air conditioning settings:

MAX: Provides maximum cooling or quick cool-down on very hot days. This setting also helps prevent outside odors from entering your vehicle.
This setting recirculates much of the air inside your vehicle, and it should not be used for long periods because the air may become too cold and dry. This setting is not recommended if an occupant is smoking.

NORM: Use for normal cooling on hot days. This setting brings in outside air, cools it and directs it through the instrument panel outlets.

BI-LEV (Bi-Level): Use on cool, but sunny days. This setting brings in outside air, but directs it in two ways. The cool air is directed to the upper portion of your body through the instrument panel outlets, but most warmed air is directed through the heater ducts and a little to the defrost and side window vents. At times this temperature difference may be more apparent than others.
Heating and Ventilation
When you don't need to cool the outside air, use these next settings. You can leave the air as it is or heat it.

The air conditioner compressor doesn't run in these settings. This reduces the engine load, resulting in improved fuel economy (gas mileage).

VENT: For mild outside temperatures, when little heating or cooling is needed, push VENT. Air flow is through the instrument panel outlets. Slide the temperature control lever to a comfortable level.

HEAT: When outside temperatures are cold, push HEAT. Slide the temperature control lever to a comfortable level. For maximum heating, slide it all the way to the right.

This setting will send most of the heated air through the ducts near the floor. The rest will come out of the defroster vents and side window defogger vents.

Defogging and Defrosting
There are two settings for clearing your windows. For each setting, adjust the temperature control as desired. The air conditioner compressor will run in these settings to remove moisture from the air when the temperature is above freezing.

This setting allows half of the air to flow to the floor heater ducts, and half to go to the windshield and side window vents located in the windshield pillars. Use this setting to warm passengers while keeping the windshield clear.

The DEF setting directs 90% of the air through the defroster vents and the side window vents, and 10% to the floor.
Defogging and Defrosting (Cont.)

To rapidly defrost the windshield, slide the temperature control lever all the way to WARM and press the DEF button.
Adjust the fan to the highest speed.

Your vehicle is equipped with side window defogger vents located on the window pillar. For additional side window defogging, push the BI-LEV button, set the fan control on high and aim the side vents on the instrument panel toward the side windows. For increased air flow to the side vents, close the center vents.

Rear Window Defogger (Option)

The rear window defogger uses a warming grid to remove fog from the rear window. Press R DEFOG to turn on. The defogger will turn off automatically after about 10 minutes of use. If you turn it on again, the defogger will operate for about five minutes only. You can also turn the defogger off by turning off the ignition or pressing the R DEFOG button again.

Do not attach a temporary vehicle license across the defogger grid on the rear window.
Electronic Climate Control (OPTION)

This system allows you to set the temperature you want. It also lets you choose automatic air flow and direction control, or air flow and direction settings you select. Your vehicle also has the flow-through ventilation system described later in this section.

The digital screen displays the outside temperature, the inside temperature setting and the fan speed.

When you select the AUTO mode, the air conditioner compressor will operate if the outside temperature is above freezing.

The air conditioner compressor also operates in DEFOG, DEF (Defrost), and BI-LEV (Bi-Level) when the outside temperature is above freezing.

COOL/WARM: Sets the interior temperature you want. Press COOL to lower the inside temperature setting; press WARM to raise the setting. The temperature you set will be displayed on the digital screen.

Once you set the temperature, the system will try to maintain the set temperature, whether you are using the heating or cooling controls. But if you set the temperature for 60°F (16°C) or 90°F (32°C), the fan will stay on high speed unless you select a different speed.

Your system has an interior temperature sensor that detects increased interior...
Electronic Climate Control

(Cont.)

1. Set the temperature you want with the COOL/WARM switch.
2. Press the AUTO switch. The AUTO symbol will appear on the digital screen.

The system will approach the temperature you select as quickly as possible. For most efficient operation, just set the system temperature where you would like it and drive away.

OUTS TEMP: Press to have the outside temperature displayed on the digital screen. Press again to return to the inside temperature setting.

If the system is left in the outside temperature mode, the outside temperature will be displayed except when changing the inside temperature setting using the COOL/WARM switch. The display will return to the outside temperature setting in about five seconds.

Use the following controls when the system is not set on AUTO:

- Press the top of the switch to raise the fan speed, the bottom of the switch to lower the fan speed. The fan symbol and bar graph will be displayed on the digital screen.

When the AUTO switch is pressed, the fan symbol will go out and the fan will return to automatic operation.

If the Fahrenheit (F°) or Celsius (C°) symbol begins to flash, or flashes when you turn on the ignition, it indicates an electrical problem with your air conditioning system. The flashing will continue for about two minutes. It means you should have your system serviced.
**Directional Controls**

When the following buttons are pressed, an indicator light will glow above the button.

**BI-LEV (Bi-Level):** Use on cool, but sunny days. This setting brings in the outside air, but directs it in two ways. The cool air is directed to the upper portion of your body through the instrument panel outlets, but most warmed air is directed through the heater ducts and a little to the defrost and side window vents. At times this temperature difference may be more apparent than others.

**UPPER:** Press to direct air flow through the instrument panel outlets only.

**LOWER:** Press to direct 90% of the air flow through the heater ducts, and 10% of the air flow through the windshield defroster vents.

**DEFOG:** Press to direct half the air to the windshield, and the other half through the heater ducts.

**DEF (Defrost):** Press to direct 90% of the air to the windshield and side window vents, and 10% to the floor. The fan will automatically go to high. For a lower fan speed, press the fan switch.

**OFF:** Press to turn off the system. Some air will still come from the outlets at the floor.
Comfort Controls & Audio Systems

**Steering Wheel Touch Controls for Climate Control (OPTION)**
Some heating and cooling controls can be adjusted at the steering wheel. These touch controls also operate some audio controls. See the Index under Steering Wheel Touch Controls for Audio System.

**FAN:** Press the upper part of the control to increase the fan speed; press the lower part to reduce the fan speed.

**TEMP:** Press the upper part of the control to raise the inside temperature setting; press the lower part to lower the setting.

**MODE:** This control can be used to select the direction of air flow (BI-LEV, UPPER, or LOWER settings), or to select DEFOG, DEF (Defrost) or AUTO. Press the top of the control to move to the next mode on the right of the climate control panel. Press the bottom of the control to move to the next mode on the left. The indicator light will glow above the selected mode, or AUTO will appear on the digital display.

**Rear Window Defogger (OPTION)**

**R DEFOG:** Press to warm the defogger grid on the rear window. The indicator light will glow while the rear window defogger is operating. The rear window defogger will turn off automatically after about 10 minutes of use. If you turn it on again, the defogger will operate for about five minutes only. You can also turn the defogger off by turning off the ignition or pressing the R DEFOG switch again.

Do not attach a temporary vehicle license across the defogger grid on the rear window.
Flow-Through Ventilation System
Your Oldsmobile’s flow-through ventilation system supplies outside air into the vehicle when it is moving. Outside air will also enter the vehicle when the heater or the air conditioning fan is running.

Ventilation Tips
- Keep the hood and front air inlet free of ice, snow, or any other obstruction (such as leaves). The heater and defroster will work far better, reducing the chance of fogging the inside of your windows.
- When you enter a vehicle in cold weather, set the blower fan to the highest setting for a few moments before driving off. This helps clear the intake ducts of snow and moisture and reduces the chance of fogging the inside of your windows.
- Keep the air path under the front seats clear of objects. This helps air to circulate throughout your vehicle.
The following pages describe the audio systems available for your Oldsmobile, and how to get the best performance from them. Please read about the system in your vehicle.

### CAUTION

Hearing damage from loud noise is almost undetectable until it is too late. Your hearing can adapt to higher volumes of sound. Sound that seems normal can be loud and harmful to your hearing. Take precautions by adjusting the volume control on your radio to a safe sound level before your hearing adapts to it.

To help avoid hearing loss or damage:
1. Adjust the volume control to the lowest setting.
2. Increase volume slowly until you hear comfortably and clearly.

### NOTICE

Before you add any sound equipment to your vehicle—like a tape player, CB radio, mobile telephone or two-way radio—be sure you can add what you want. If you can, it's very important to do it properly. Added sound equipment may interfere with the operation of your vehicle's engine, Delco radio or other systems, and even damage them. And, your vehicle's systems may interfere with the operation of sound equipment that has been added improperly.

So, before adding sound equipment, check with your dealer and be sure to check Federal rules covering mobile radio and telephone units.

### Setting the Clock

No matter which radio system you have in your vehicle, setting the clock is easy.

For Radios with SCAN and One SEEK Button:
1. With the radio off and the ignition on, press SET. The SET indicator will appear on the digital screen for five seconds.
2. During those five seconds, you can set the clock to the correct hour and minute by depressing the SEEK and SCAN buttons. For some radios SEEK will set the hour, for others it sets the minute. For some radios, SCAN will set the hour, for others it sets the minute.
For Radios with SCAN and SEEK\(^\uparrow\) and SEEK\(^\downarrow\):
1. With the radio off and the ignition on, press SET. The SET indicator will appear on the digital screen for five seconds.
2. Press and hold SCAN until the correct hour appears on the display.
3. Press SET again.
4. Press and hold SEEK\(^\uparrow\) or SEEK\(^\downarrow\) until the correct minute appears on the display.

**AM/FM Stereo Radio**
The digital display indicates information on time or radio station frequency, the AM or FM radio band, whether the station is in stereo, and other radio functions.

**VOLUME:** Turn the upper knob to turn the radio on or off, or to adjust volume. Press it to change the display between the clock and the radio station frequency when the radio is on.

The control ring behind the VOLUME knob adjusts the left/right speaker balance.

**TUNE:** This knob has two functions. Turn it to the left or right to tune in radio stations (the radio station frequency will be displayed on the digital screen). Press this knob to change between the AM and FM bands.
AM/FM Stereo Radio (cont.)

The control ring behind the TUNE knob adjusts the front/rear speaker balance.

TREB (Treble): Slide this lever up to increase treble, or down to decrease it.

BASS: Slide this lever up to increase bass, or down to decrease it.

SCAN: Press to listen for a few seconds to the next station on the AM or FM band; the scan will continue every few seconds until you press SCAN again to stop on a particular station. You can also press the upper knob (VOLUME) to stop the scan.

SEEK: Each time you press SEEK, you will tune in the next station higher on the radio band.

To Preset Radio Stations:

Using the four pushbuttons numbered 1-4, you can set up to 14 radio stations (seven AM and seven FM).

1. Use the lower knob (TUNE) to tune in the station you want.
2. Press SET. The SET indicator will appear on the digital screen for five seconds.
3. While the SET indicator is displayed, press one of the four pushbuttons.
4. Repeat steps 1-3 for each of four AM and four FM stations.

Up to three additional stations on each band may be preset by “pairing” pushbuttons:

1. Tune in the desired station.
2. Press SET, and within five seconds press any two adjacent pushbuttons at the same time.
3. The station can be tuned in when the same two pushbuttons are pressed at the same time.
AM/FM Stereo Radio with Cassette Player

The digital display indicates information on time or radio station frequency, the AM or FM radio band, whether the station is in stereo, and other radio functions.

VOLUME: Turn the upper knob to turn the radio on or off, or to change volume. Press it to change the display between the clock and the radio station frequency when the radio is on.

The control ring behind the VOLUME knob adjusts the left/right speaker balance.

TUNE: This knob has two functions. Turn it to the left or right to tune in radio stations (the radio station frequency will be displayed on the digital screen). Press this knob to change between the AM and FM bands.

The control ring behind the TUNE knob adjusts the front/rear speaker balance.

TREB (Treble): Slide this lever up to increase treble, or down to decrease it.

BASS: Slide this lever up to increase bass, or down to decrease it.

SCAN: Press to listen for a few seconds to the next station on the AM or FM band; the scan will continue every few seconds until you press SCAN again to stop on a particular station. You can also press the upper knob (VOLUME) to stop the scan.

SEEK: Each time you press SEEK, you will tune in the next station higher on the radio band.

To Preset Radio Stations:

Using the four pushbuttons below the digital display, you can set up to 14 radio stations (seven AM and seven FM).

1. Use the lower knob (TUNE) to tune in the station you want.
AM/FM Stereo Radio with Cassette Player (CONT.)

2. Press SET. The SET indicator will appear on the digital screen for five seconds.
3. While the SET indicator is displayed, press one of the four pushbuttons.
4. Repeat steps 1-3 for each of four AM and four FM stations.

Up to three additional stations on each band may be preset by "pairing" pushbuttons:
1. Tune in the desired station.
2. Press SET, and within five seconds press two adjacent pushbuttons at the same time.
3. The station can be tuned in when the same two pushbuttons are pressed at the same time.

To Play a Cassette Tape:
With the power on, insert a tape into the cassette door. Using tapes that are longer than 90 minutes (45 minutes on each side) is not recommended.

When the right indicator arrow is lit, selections listed on the bottom side of the cassette are playing. When the left indicator arrow is lit, selections listed on the top side of the cassette are playing. To change sides of the tape, press the upper control knob (VOLUME) while the cassette is playing. The tape player automatically begins playing the other side when it reaches the end of the tape.

Fast Forward: Press the button with the arrow pointing in the same direction that the tape is playing. To stop fast forward, press the STOP-EJECT button.

Reverse: Press the button with the arrow pointing in the opposite direction that the tape is playing. To stop reverse, press the STOP-EJECT button.

STOP-EJECT: To stop playing a tape, fully press this button. The cassette will be partially ejected, and the radio will begin playing.
AM/FM Stereo with Cassette Player and Music Search
The digital display indicates information on time or radio station frequency, the AM or FM radio band, whether the station is in stereo, and other radio functions.

POWER: Turns the unit on and off when the ignition is on.

VOL (Volume): Press the top of the switch to increase the volume. Press the bottom of the switch to decrease the volume. The volume setting will be displayed. To quickly reduce the volume to a low level, press the center of the VOL button.

BASS: Adjusts the bass level.

TREB (Treble): Adjusts the treble level.
Press the top of each switch to increase the level, or the bottom to decrease the level. Press the center of each switch for preset levels.

Balance Controls
Adjusts the left/right and front/rear speaker balance to your individual taste. When you change either adjustment, the bottom of the digital screen will display the point of balance you have selected. For the normal setting preset at the factory, press the left and right or top and bottom buttons at the same time.
Comfort Controls & Audio Systems

AM/FM Stereo with Cassette Player and Music Search (cont.)

Radio Controls

The band you select will be displayed on the digital screen. The frequency of the station will also be displayed, and if the station is in stereo, the STEREO indicator will also be displayed.

RCL (Recall): Press to change between the clock and the radio station frequency display on the digital screen, when the radio is on.

AM: Press to select the AM band.
FM: Press to select the FM band.
SEEK▲: Press to tune in the next station higher on the band.
SEEK▼: Press to tune in the next station lower on the band.
SCAN: Press to listen for a few seconds to the next station on the AM or FM band; the scan will continue every few seconds until you press SCAN again to stop on a particular station.
TUNE: Press this control to tune in stations higher or lower on the AM or FM radio band.

To Preset Radio Stations:
You can preselect up to 10 radio stations (five AM and five FM) and tune to any of them by pushing a single button. Here’s how:
1. Tune to a desired station with the lower knob.
2. Press SET.
3. Within about five seconds, press one of the five numbered pushbuttons. The station you selected will be automatically tuned whenever you press this button again.
4. Repeat for up to four more stations on the same band, and up to five on the other band.
To Play a Cassette Tape:
Your cassette tape player is designed to work best with tapes that play for 30 to 45 minutes per side. Tapes that run longer than that are so thin they may not work well in this player.

With the unit on, press a cassette into the slot marked AUTO REVERSE, tape side first. Adjust volume, balance, fade and tone as described earlier.

Here are your other tape player controls:

PROG (Program): Press to switch from one side of the tape to the other. The unit switches automatically at the end of a side.

CRO: Press to adjust the unit for high bias chrome or metal tapes. For standard bias tapes, press again to return to the factory-preset adjustment.

REV (Reverse): Press to rewind the tape rapidly. The tape will stop at the end, or when you press REV or PROG lightly. The radio will play while the tape is rewinding.

FWD (Forward): Press to advance the tape rapidly. The tape will stop at the end, or when you press FWD or PROG lightly. The radio will play while the tape is advancing.

PREV (Previous): Press to repeat a selection or passage. The tape will rewind and stop either at the first four-second quiet spot or when you press PREV again (or PROG).

SEEK: Press to advance to the next selection or passage. The tape will fast-forward and stop either at the first four-second quiet spot or when you press SEEK again (or PROG).

REPT (Repeat): Press to repeat a selection. The tape will rewind to the first four-second quiet spot or until you press REPT (or PROG) again.

EJECT: Press to remove the tape.
Comfort Controls & Audio Systems

AM/FM Stereo with Cassette Player and Graphic Equalizer
The digital display indicates information on time or radio station frequency, the AM or FM radio band, whether the station is in stereo, and other radio functions.

POWER: Turns the unit on and off when the ignition is on.

VOL (Volume): Press the top of the switch to increase the volume. Press the bottom of the switch to decrease the volume. The volume setting will be displayed. To quickly reduce the volume to a low level, press the center of the VOL button.

Equalizer Controls
Boost the bass, emphasize a voice in a song, brighten the treble—your equalizer gives you freedom to adjust five separate frequencies of sound to your individual taste. Move a lever up to emphasize a frequency, move it down to de-emphasize. It's best to begin with the levers in the middle position, then adjust individual levers as you like.

Balance Controls
 Adjusts the left/right and front/rear speaker balance to your individual taste. When you change either adjustment, the bottom of the digital screen will display the point of balance you have selected. For the normal setting preset at the factory, press the center of the balance control.
Radio Controls

AM/FM: Press the AM or FM buttons to select either the AM or FM radio band. The band you select will be displayed on the digital screen. The frequency of the station will also be displayed, and if the station is in stereo, the STEREO indicator will also be displayed.

RCL (Recall): Press to change between the clock and the radio station frequency display on the digital screen, when the radio is on.

SEEK ▲: Press to tune to the next station higher on the band.

SEEK ▼: Press to tune to the next station lower on the band.

SCAN: Press to listen for a few seconds to the next station on the AM or FM band; the scan will continue every few seconds until you press SCAN again to stop on a particular station.

TUNE: Press this control to tune in stations higher or lower on the AM or FM radio band.

To Preset Radio Stations:
The five pushbuttons (numbered 1-5) can be used to preset up to ten radio stations (five AM and five FM).

1. Tune the digital display to the station you want.

2. Press SET. The SET indicator will appear on the digital screen for five seconds.

3. While the SET indicator is displayed, press one of the five pushbuttons.

4. Repeat steps 1-5 for each of five AM and five FM stations.
Am/FM Stereo with Cassette Player and Graphic Equalizer (CONT.)

Tape Player
Your tape player sets itself automatically for tape bias. This radio system has automatic Dolby B NR\textsuperscript{©} to reduce background noise on Dolby encoded tapes. Dolby\textsuperscript{©} Noise Reduction is manufactured under license from Dolby Laboratories Licensing Corporation. Dolby\textsuperscript{©} and the symbol are trademarks of Dolby Laboratories Licensing Corporation.
Press \textbf{POWER} to turn the radio on. Then push a cassette into the cassette entry door (the tape side goes in first).

Using tapes that are longer than 90 minutes (45 minutes on each side) is not recommended

\textbf{FWD (Fast Forward)}: Press to advance the tape rapidly; press again to play. (The radio plays while a tape is fast forwarding.)

\textbf{REV (Reverse)}: Press to reverse the tape rapidly; press again to play tape. (The radio plays while a tape is rewinding.)

\textbf{SEEK}: Press to advance the tape to the beginning of the next selection.

\textbf{REPT (Repeat)}: Press to rewind the tape to the beginning of a selection.

\textbf{PROG (Program)}: Press to change the side of tape being played. When the arrow pointing up is lighted, the selections listed on the top side of the tape are played. When the arrow pointing down is lighted, selections listed on the bottom side of the tape are played. The tape player automatically begins playing the other side when it reaches the end of the tape.

\textbf{CRO}: This button sets tape bias. When playing high bias chrome or metal tapes, press the button to turn the button light on. When playing standard tapes, press again to turn the light off.

\textbf{EJECT}: Press to have the cassette tape ejected (the radio will then play).
**AM/FM Stereo with Compact Disc Player**

The digital display indicates information on time or radio station frequency, the AM or FM radio band, whether the station is in stereo, and other radio functions.

**POWER:** Press to turn the unit on and off when the ignition is on.

**VOL (Volume):** Adjusts the volume up or down, and the bottom of the digital screen displays the setting. For a normal listening level preset at the factory, press the center of the switch.

**TUNE:** Press this switch to tune in higher frequencies and lower frequencies.

**SEEK:** Press to tune automatically to the next station higher on the band.

**BAL (Balance):** Adjusts the left/right and front/rear speaker balance to your individual taste. When you change either adjustment, the bottom of the digital screen will display the point of balance you have selected. For the normal setting preset at the factory, press the left and right or front and rear buttons at the same time.

**SCAN:** Press to listen for a few seconds to the next station on the AM or FM band; the scan will continue every few seconds until you press SCAN again to stop on a particular station.

**RCL (Recall):** Press to change between the clock and the radio station frequency displayed on the digital screen.

**AM/FM:** Press to switch between the AM and FM bands.
To Play a Compact Disc:
Many of the controls for the radio also have functions for the compact disc player, as explained here.
Don't use mini-discs that are called singles. They won't eject. Use only full-size compact discs.
1. Press POWER to turn the unit on.
2. Insert a disc part-way into the slot, with the label side up. The player will pull it in. In a few seconds, the disc should play.
If the disc comes back out:
- The disc may be upside down.
- The disc may be dirty, scratched or wet.
- There may be too much moisture in the air (wait about one hour and try again).
- The player may be too hot, or the road may be too rough for the disc to play.
While a disc is playing, the CD indicator is displayed on the digital screen, as is the clock.
RCL (Recall): Press once to see which track is playing. Press again within five seconds to see how long your selection has been playing. The track number also will be displayed when the volume is changed or a new track starts to play.
PREV (Previous): Press to play a track again. If you hold the PREV button, the disc will keep backing up to previous tracks.
NEXT: Press when you want to hear the next track. If you hold the NEXT button, the disc will keep advancing to other tracks.
REV (Reverse): Press and hold to rapidly back up to a favorite passage. Release to resume playing.
FF (Fast Forward): Press and hold to rapidly advance the disc. Release to resume playing.
COMP (Compression): Depressing this button makes soft and loud passages more equal in volume. Press again to resume normal play.

To Preset Radio Stations:
The five pushbuttons in the lower right corner can be used to preset up to ten radio stations (five AM and five FM). The buttons have other uses when you are playing a compact disc.
1. Tune the digital display to the station you want.
2. Press SET. The SET indicator will appear on the digital screen for five seconds.
3. While the SET indicator is displayed, press one of the five pushbuttons.
4. Repeat steps 1-3 for each of five AM and five FM stations.
When Finished with the Compact Disc Player:

If you press POWER or turn off the ignition, the disc will stay in the player and start again when you turn on the ignition or power switch. The disc will begin playing at the point where it had been stopped.

ST/PL (Stop/Play): Press to stop the disc player; the radio will play. Press again to play the disc (the player will start playing the disc where it was stopped earlier).

EJCT (Eject): Press to eject the disc; the radio will play.

CD Player Anti-Theft Feature

Delco LOC II® is a security feature that can be used or ignored. If you ignore it, your system will play normally. If you use it, your system cannot be turned on if it is stolen. These instructions will tell you how to enter a secret code into your system. Then, if battery power is lost for any reason, the secret code must be entered again before the system can be turned on.

To Set:

1. Write down any six-digit number and keep it in a safe place. This is your secret code.
2. Turn the ignition to Accessory or Run.
3. Press the POWER button to turn the radio on.
4. Press the PREV and FF buttons at the same time and hold until **--** shows on the display.
   You now have only 15 seconds between each of the following steps.
5. Press SET and 000 appears on the display.
6. Press and hold SEEK until the first digit of your code appears.
7. Press and hold SCAN until the second and third digits of your code appear.
8. Press AM-FM (000 appears).
9. Press and hold SEEK until the fourth digit of your code appears.
10. Press and hold SCAN until the fifth and sixth digits of your code appear.
11. Press AM/FM (REP will appear for five seconds, then 000).
12. Repeat steps 6 through 10. Then press the AM/FM button again. SEC will appear, indicating that Delco LOC II® is set, and your radio is secure. If **--** appears, the steps were not successful and you must repeat the entire procedure.
Comfort Controls & Audio Systems

CD Player Anti-Theft Feature
(CONT.)
To Disable the Anti-Theft System:
Enter your secret code by following these steps (you will have only 15 seconds between each step).
1. Turn the ignition to Accessory or Run and the radio off, then press the PREV and FF buttons of the station presets. SEC will appear, showing the radio is secure.
2. Press SET and 000 appears on the display.
3. Press and hold SEEK until the first digit of your secret code appears.
4. Press and hold SCAN until the second and third digits of your code appear.
5. Press AM-FM (000 will appear on the display).
6. Press and hold SEEK until the fourth digit of your code appears.
7. Press and hold SCAN until the fifth and sixth digits of your code appear.
8. Press AM/FM. If the display shows "---", the radio is unsecured and will play again. If the display shows SEC, the steps were not successful and the numbers did not match the secret code.

If you lose or forget your code, see your dealer.

If you lose battery power, when the battery is reconnected, the system will not turn on and LOC will appear. Follow steps 1-8 for disabling your system (the time will appear if you are successful). If SEC appears, the numbers did not match and your unit is still locked.

Steering Wheel Touch Controls for Audio System (OPTION)
Some audio system functions described in the previous pages can also be operated with the Steering Wheel Touch Controls option. These touch controls also operate some climate controls. See the Index under Steering Wheel Touch Controls for Climate Control.

PROG (Program): Press the top of this button to hear stations which you have preset on your radio.
AM/FM: Press the bottom of this button to change between AM and FM bands.
**VOL (Volume):** Press the top of the switch to increase volume or the bottom to decrease it. Press the middle of the switch to mute the audio system. Press any switch to return to your original volume level.

**SEEK:** Each time you press the top of the switch, you will tune in a radio station higher on the AM or FM band; each time you press the bottom of the switch, you will tune in a radio station lower on the AM or FM band. With a CD player, pressing **SEEK** will advance the tracks forward or back.

**Audio Bass Control (OPTION):**
You can adjust the volume of bass frequencies, from 50-150 Hz, by sliding this lever from left to right. This control will not affect the volume of frequencies higher than 150 Hz.

**Understanding Radio Reception**

**FM Stereo**
FM Stereo will give you the best sound, but FM signals will reach only about 10 to 40 miles (16 to 65 km). Tall buildings or hills can interfere with FM signals, causing the sound to come and go.

**AM**
The range for most AM stations is greater than for FM, especially at night. The longer range, however, can cause stations to interfere with each other. AM can also pick up noise from things like storms and power lines. To lower this noise, try reducing the treble level.
Understanding Radio Reception
(CONT.)

AM Stereo
Your Delco® system may be able to receive C-Quam® stereo broadcasts. Many AM stations around the country use C-Quam® to produce stereo, though some do not. C-Quam® is a registered trademark of Motorola, Inc. If your Delco® system can get C-Quam® signals, your stereo indicator light will come on when you are receiving it.

Care of Your Cassette Tape Player
A tape player that is not cleaned regularly can cause reduced sound quality, ruined cassettes, or a damaged mechanism. Cassette tapes should be stored in their cases away from contaminants, direct sunlight, and extreme heat. If they aren’t, they may not operate properly or cause failure of the tape player.

Your tape player should be cleaned regularly each month or after every 15 hours of use. If you notice a reduction in sound quality, try a known good cassette to see if the tape or the tape player is at fault. If this other cassette has no improvement in sound quality, clean the tape player.

Clean your tape player with a wiping-action, non-abrasive cleaning cassette, and follow the directions provided with it.

Cassettes are subject to wear and the sound quality may degrade over time. Always make sure that the cassette tape is in good condition before you have your tape player serviced.
Care of Your Compact Discs
Handle discs carefully. Store them in their original cases or other protective cases and away from direct sunlight and dust. If the surface of a disc is soiled, dampen a clean, soft cloth in a mild, neutral detergent solution and clean it, wiping from the center to the edge. Be sure never to touch the signal surface when handling discs. Pick up discs by grasping the outer edges or the edge of the hole and the outer edge.

Fixed Mast Antenna
The fixed mast antenna can withstand most car washes without being damaged. If the mast should ever become slightly bent, you can straighten it out by hand. If the mast is badly bent, as it might be by vandals, you should replace it. Check every once in a while to be sure the mast is still tightened to the fender.

Power Antenna Mast Care
Your power antenna will look its best and work well if it’s cleaned from time to time.

To Clean the Antenna Mast:
1. Turn on the ignition and radio to raise the antenna to full mast extension.
2. Dampen a clean cloth with mineral spirits or equivalent solvent.
3. Wipe the cloth over the mast sections, removing any dirt.
Power Antenna Mast Care (cont.)

4. Wipe dry with a clean cloth before retracting.

5. Make the antenna go up and down by turning the radio or ignition on and off.

6. Then repeat if necessary.

NOTICE
Don’t lubricate the power antenna. Lubrication could damage it.

NOTICE
Before entering an automatic car wash, turn off your radio to make the power antenna go down. This will prevent the mast from possibly getting damaged. If the antenna does not go down when you turn the radio off, it may be damaged or need to be cleaned. In either case, lower the antenna by hand by carefully pressing the antenna down.

If the mast portion of your antenna is damaged, you can easily replace it. See your dealer for a replacement kit and follow the instructions in the kit.
Here you'll find information about driving on different kinds of roads and in varying weather conditions. We've also included many other useful tips on driving.

Road Signs
The road signs you see everywhere are coded by color, shape, and symbols. It's a good idea to know these codes so that you can quickly grasp the basic meaning or intent of the sign even before you have a chance to read it.

Color of Road Signs
Red means Stop. It may also indicate that some movement is not allowed. Examples are Do Not Enter, Wrong Way, or No Parking.

Yellow indicates a general warning. Slow down and be careful when you see a yellow sign. It may signal a railroad crossing ahead, a no passing zone, or some other potentially dangerous situation. Likewise, a yellow solid line painted on the road means Don’t Cross.

Green is used to guide the driver. Green signs may indicate upcoming freeway exits or show the direction you should turn to reach a particular place.

Blue signs with white letters show motorists' services.
Orange indicates road construction or maintenance. You'll want to slow down when you see an orange sign, as part of the road may be closed off or torn up. And there may be workers and maintenance vehicles around, too.

Shape of Road Signs
The shape of the sign will tell you something, too.

An octagonal (eight-sided) sign means **Stop**. It is always red with white letters.

A diamond-shaped sign is a warning of something ahead—for example, a curve, steep hill, soft shoulder, or a narrow bridge.

A triangle, pointed downward, indicates **Yield**. It assigns the right of way to traffic on certain approaches to an intersection.

A triangular sign also is used on two-lane roads to indicate a no passing zone. This sign will be on the left side of the roadway.

Brown signs point out recreation areas or points of historic or cultural interest.
Your Driving and the Road

Shape of Road Signs (cont.)
Rectangular (square or oblong) signs show speed limits, parking regulations, give directions, and such information as distances to cities.

Symbols on Road Signs
There are many international road signs in use today.

Traffic Lights
We're all familiar with traffic lights or stop lights. Often green arrows are being used in the lights for improved traffic control. On some multilane roads, green arrows light up, indicating that traffic in one or more lanes can move or make a turn. Green arrows don't mean "go no matter what." You'll still need to proceed with caution, yielding the right of way to pedestrians and sometimes to other vehicles.

Some traffic lights also use red arrows to signify that you must stop before turning on red.

The basic message of many of these signs is in pictures or graphic symbols. A picture within a circle with a diagonal line across it shows what not to do.
Many city roads and expressways, and even bridges, use reversible-lane traffic control during rush hours. A red X light above a lane means no driving in that lane at that time. A green arrow means you may drive in that lane. Look for the signs posted to warn drivers what hours and days these systems are in effect.

Pavement Markings
Pavement markings add to traffic signs and signals. They give information to drivers without taking attention from the roadway. A solid yellow line on your side of the road or lane means Don't Cross.

Your Own Signals
Drivers signal to others, too. It's not only more polite, it's safer to let other drivers know what you are doing. And in some places the law requires driver signals.

Turn and Lane Change Signals:
Always signal when you plan to turn or change lanes.

If necessary, you can use hand signals: (1) signal out the window: Left arm straight out for a left turn, down for slow or about-to-stop, and up for a right turn.

Slowing Down: If time allows, tap the brake pedal once or twice in advance of slowing or stopping. This warns the driver behind you.

Disabled: Your four-way flashers signal that your vehicle is disabled or is a hazard. See the Index under Hazard Warning Flashers.

Traffic Officer
The traffic police officer is also a source of important information. The officer's signals govern, no matter what the traffic lights or other signs say.

The next section discusses some of the road conditions you may encounter.
Defensive Driving

The best advice anyone can give about driving is: Drive defensively.

Please start with a very important safety device in your Oldsmobile: Buckle up. (See the Index under Safety Belts.)

Defensive driving really means “be ready for anything.” On city streets, rural roads, or freeways, it means “always expect the unexpected.”

Assume that pedestrians or other drivers are going to be careless and make mistakes. Anticipate what they might do. Be ready for their mistakes.

Expect children to dash out from behind parked cars, often followed by other children. Expect occupants in parked cars to open doors into traffic. Watch for movement in parked cars—someone may be about to open a door.

Expect other drivers to run stop signs when you are on a through street. Be ready to brake if necessary as you go through intersections. You may not have to use the brake, but if you do, you will be ready.

If you’re driving through a shopping center parking lot where there are well-marked lanes, directional arrows, and designated parking areas, expect some drivers to ignore all these markings and dash straight toward one part of the lot.

Pedestrians can be careless. Watch for them. In general, you must give way to pedestrians even if you know you have the right of way.

Rear-end collisions are about the most preventable of accidents. Yet they are common. Allow enough following distance. It’s the best defensive driving maneuver, in both city and rural driving. You never know when the vehicle in front of you is going to brake at the time suddenly.

Here’s a final bit of information about defensive driving. The most dangerous time for driving in the U.S. is very early on Sunday morning. In fact, GM Research studies show that the most and the least dangerous times for driving, every week, fall on the same day. That day is Sunday. The most dangerous time is Sunday from 3 a.m. to 4 a.m. The safest time is Sunday from 10 a.m. to 11 a.m. Driving the same distance on a Sunday at 5 a.m. isn’t just a little more dangerous than it is at 10 a.m. It’s about 134 times more dangerous!

That leads to the next section.
Drunken Driving

Death and injury associated with drinking and driving is a national tragedy. It's the number one contributor to the highway death toll, claiming thousands of victims every year. Alcohol takes away three things that anyone needs to drive a vehicle:

* Judgment
* Muscular Coordination
* Vision

Police records show that half of all motor vehicle-related deaths involve alcohol—a driver, a passenger or someone else, such as a pedestrian, had been drinking. In most cases, these deaths are the result of someone who was drinking and driving. Over 25,000 motor vehicle-related deaths occur each year because of alcohol, and thousands of people are injured.

Just how much alcohol is too much if a person plans to drive? Ideally, no one should drink alcohol and then drive. But if one does, then what's "too much"? It can be a lot less than many might think. Although it depends on each person and situation, here is some general information on the problem.

The Blood Alcohol Content (BAC) of someone who is drinking depends upon four things:

* How much alcohol is in the drink.
* The drinker's body weight.
* The amount of food that is consumed before and during drinking.
* The length of time it has taken the drinker to consume the alcohol.

According to the American Medical Association, a 180-pound (82 kg) person who drinks three 12-ounce (355 ml) bottles of beer in an hour will end up with a BAC of about 0.06 percent. The person would reach the same BAC by drinking three 4-ounce (120 ml) glasses of wine or three mixed drinks if each had 1½ ounces (45 ml) of a liqueur like whiskey, gin or vodka.

It's the amount of alcohol that counts. For example, if the same person drank three double martinis (3 ounces or 90 ml of liquor each) within an hour, the person's BAC would be close to 0.13 percent. A person who consumes food just before or during drinking will have a slightly lower BAC level.
Your Driving and the Road

Drunken Driving (cont.)

The law in most U.S. states sets the legal limit at a BAC of 0.10 percent. In Canada the limit is 0.08 percent, and in some other countries it's lower than that. The BAC will be over 0.10 percent after three to six drinks (in one hour). Of course, as we've seen, it depends on how much alcohol is in the drinks, and how quickly the person drinks them.

But it's very important to keep in mind that the ability to drive is affected well below a BAC of 0.10 percent. Research shows that the driving skills of many people are impaired at a BAC approaching 0.05 percent, and that the effects are worse at night. All drivers are impaired at BAC levels above 0.05 percent. Statistics show that the chance of being in an accident increases sharply for drivers who have a BAC of 0.05 percent or above. A driver with a BAC level of 0.06 percent (three beers in one hour for a 180-pound or 82 kg person) has doubled his or her chance of having an accident. At a BAC level of 0.10 percent, the chance of that driver having an accident is six times greater; at a level of 0.15 percent, the chances are twenty-five times greater! And, the body takes about an hour to rid itself of the alcohol in one drink. No amount of coffee or number of cold showers will speed that up.

The graph shows drinking that will result in a BAC of 0.05% in the time shown. The number of drinks is plotted against the body weight in pounds. The graph indicates that the number of drinks required to reach a BAC of 0.05% increases with body weight.
Drinking and then driving is very dangerous. Your reflexes, perceptions, and judgment can be affected by even a small amount of alcohol. You could have a serious—or even fatal—accident if you drive after drinking. Please don't drink and drive or ride with a driver who has been drinking. Ride home in a cab, or if you're with a group, designate a driver who will not drink.

**CAUTION**

Drinking and then driving is very dangerous. Your reflexes, perceptions, and judgment can be affected by even a small amount of alcohol. You could have a serious—or even fatal—accident if you drive after drinking. Please don't drink and drive or ride with a driver who has been drinking. Ride home in a cab, or if you're with a group, designate a driver who will not drink.

**Control of a Vehicle**

You have three systems that make your vehicle go where you want it to go. They are the brakes, the steering, and the accelerator. All three systems have to do their work at the places where the tires meet the road.

Sometimes, as when you're driving on snow or ice, it's easy to ask more of these control systems than the tires and road can provide. That means you can lose control of your vehicle.
Braking

Braking action involves perception time and reaction time.

First, you have to decide to push on the brake pedal. That’s perception time. Then you have to bring up your foot and do it. That’s reaction time.

Average reaction time is about ¾ of a second. But that’s only an average. It might be less with one driver and as long as two or three seconds or more with another. Age, physical condition, alertness, coordination, and eyesight all play a part. So do alcohol, drugs, and frustration. But even in ½ of a second, a vehicle moving at 60 mph (100 km/h) travels 66 feet (20 m). That could be a lot of distance in an emergency, so keeping enough space between your vehicle and others is important.

And, of course, actual stopping distances vary greatly with the surface of the road (whether it’s pavement or gravel); the condition of the road (wet, dry, icy); tire tread; and the condition of your brakes.

Most drivers treat their brakes with care. Some, however, overwork the braking system with poor driving habits.

* Avoid needless heavy braking. Some people drive in spurts—heavy acceleration followed by heavy braking—rather than keeping pace with traffic. This is a mistake. Your brakes may not have time to cool between hard stops. Your brakes will wear out much faster if you do a lot of heavy braking.

* Don’t “ride” the brakes by letting your left foot rest lightly on the brake pedal while driving.

**CAUTION**

“Riding” your brakes can cause them to overheat in the point that they won’t work well. You might not be able to stop your vehicle in time to avoid an accident. If you “ride” your brakes, they will get so hot they will require a lot of pedal force to slow you down. Avoid “riding” the brakes.
If you keep pace with the traffic and allow realistic following distances, you will eliminate a lot of unnecessary braking. That means better braking and longer brake life.

- If your engine ever stops while you're driving, brake normally but don't pump your brakes. If you do, the pedal may get harder to push down. If your engine stops, you will still have some power brake assist. But you will use it when you brake. Once the power assist is used up, it may take longer to stop and the brake pedal will be harder to push.

**Ante-Lock Brakes (ABS) (OPTION)**

If your Oldsmobile has this system, it has an advanced electronic braking system that will help prevent skidding.

If you have an anti-lock brake system (ABS), the brake pedal will say so.
Anti-Lock Brakes (CONT.)

And this light on the instrument panel will go on when you start your vehicle. When you start your vehicle and begin to drive away you may hear a momentary motor or clicking noise and you may even notice that your brake pedal moves a little while this is going on. This is the ABS system testing itself. If you have your foot on the brake pedal, this check won’t happen until the vehicle goes about 4 mph (6 km/h) or until you take your foot off the brake pedal.

You’ll also hear a clicking noise the next time the vehicle goes about 4 mph (6 km/h).

If there’s a problem with the anti-lock brake system, the anti-lock brake system warning light will stay on or flash. See the Index under Anti-Lock Brake System Warning Light.

Here’s how anti-lock works. Let’s say the road is wet. You’re driving safely. Suddenly an animal jumps out in front of you.

You slam on the brakes. Here’s what happens with ABS.

A computer senses that wheels are slowing down. The computer separately works the brakes at each front wheel and at the rear wheels.

The anti-lock system can change the brake pressure faster than any driver could. The computer is programmed to make the most of available tire and road conditions.
You can steer around the obstacle while braking hard.
As you brake, your computer keeps receiving updates on wheel speed and controls braking pressure accordingly.

**CAUTION**

Anti-lock doesn't change the time you need to get your foot up to the brake pedal. If you get too close to the vehicle in front of you, you won't have time to apply your brakes if that vehicle suddenly slows or stops. Always leave enough room up ahead to stop, even though you have anti-lock brakes.

**To Use Anti-Lock:** Don't pump the brakes. Just hold the brake pedal down and let anti-lock work for you. When you start your vehicle and begin to drive away, you may notice that your brake pedal moves a little while this is going on. A brief mechanical noise is normal. This is the ABS system testing itself. You also may hear a clicking noise as you accelerate after a hard stop.

**Disc Brake Wear Indicators**

Your Oldsmobile has four-wheel disc brakes. Disc brake pads have built-in wear indicators that make a high-pitched warning sound when the brake pads are worn and new pads are needed. The sound may come and go, or be heard all the time your vehicle is moving (except when you are pushing on the brake pedal firmly).

**CAUTION**

The brake wear warning sound means that sooner or later your brakes won't work well. That could lead to an accident. When you hear the brake wear warning sound, have your vehicle serviced.
Your Driving and the Road

Disc Brake Wear Indicators (CONT.)

NOTICE
Continuing to drive with worn-out brake pads could result in costly brake repair.

Some driving conditions or climates may cause a brake squeal when the brakes are first applied or lightly applied. This does not mean something is wrong with your brakes. Brake linings should always be replaced as complete axle sets.

Brake Pedal Travel
See your dealer if the brake pedal does not return to normal height, or if there is a rapid increase in pedal travel. This could be a sign of brake trouble.

Brake Adjustment
Every time you make a moderate brake stop, your disc brakes adjust for wear. If you rarely make a moderate or heavier stop, then your brakes might not adjust correctly. If you drive in that way, then—very carefully—make a few moderate brake stops about every 1,000 miles (1,600 km), so your brakes will adjust properly.
**Braking In Emergencies**

At some time, nearly every driver gets into a situation that requires hard braking. If you have anti-lock, you can steer and brake at the same time. However, if you don’t have anti-lock, your first reaction—to hit the brake pedal hard and hold it down—may be the wrong thing to do. Your wheels can stop rolling. Once they do, the vehicle can’t respond to your steering. Momentum will carry it in whatever direction it was headed when the wheels stopped rolling. That could be off the road, into the very thing you were trying to avoid, or into traffic.

If you don’t have anti-lock, use a "squeeze" braking technique. This will give you maximum braking while maintaining steering control. You do this by pushing on the brake pedal with steadily increasing pressure.

In an emergency you will probably want to "squeeze" the brakes hard without locking the wheels. If you hear or feel the wheels sliding, ease off the brake pedal. This will help you retain steering control. (If you do have anti-lock, it’s different; see the Index under Anti-Lock Brake System.) In many emergencies, steering can help you more than even the very best braking.

---

**Power Steering**

If you lose power steering assist because the engine stops or the system fails to function, you can steer but it will take much more effort.
Steering Tips—Driving on Curves

It's important to take curves at a reasonable speed.

A lot of the “driver lost control” accidents mentioned on the news happen on curves. Here’s why:

Experienced driver or beginner, each of us is subject to the same laws of physics when driving on curves. The traction of the tires against the road surface makes it possible for the vehicle to change its path when you turn the front wheels. If there's no traction, inertia will keep the vehicle going in the same direction. If you've ever tried to steer a vehicle on wet ice, you'll understand this.

The traction you can get in a curve depends on the condition of your tires and the road surface, the angle at which the curve is banked, and your speed. While you're in a curve, speed is the one factor you can control.

Suppose you're steering through a sharp curve. Then you suddenly apply the brakes. Both control systems—steering and braking—have to do their work where the tires meet the road. Unless you have four-wheel anti-lock brakes, adding the hard braking can demand too much at those places. You can lose control.

The same thing can happen if you're steering through a sharp curve and you suddenly accelerate. Those two control systems—steering and acceleration—can overwhelm those places where the tires meet the road and make you lose control.

What should you do if this ever happens? Let up on the brake or accelerator pedal, steer the vehicle the way you want it to go, and slow down. Speed limit signs near curves warn that you should adjust your speed. Of course, the posted speeds are based on good weather and road conditions. Under less favorable conditions you’ll want to go slower.

If you need to reduce your speed as you approach a curve, do it before you enter the curve, while your front wheels are straight ahead.

Try to adjust your speed so you can “drive” through the curve. Maintain a reasonable, steady speed. Wait to accelerate until you are out of the curve, and then accelerate gently into the straightaway.

When you drive into a curve at night, it's harder to see the road ahead of you because it bends away from the straight beams of your lights. This is one good reason to drive slower.
Steering in Emergencies

There are times when steering can be more effective than braking. For example, you come over a hill and find a truck stopped in your lane, or a car suddenly pulls out from nowhere, or a child darts out from between parked cars and stops right in front of you. You can avoid these problems by braking—if you can stop in time. But sometimes you can’t; there isn’t room. That’s the time for evasive action—steering around the problem.

Your Oldsmobile can perform very well in emergencies like these. First apply your brakes—but unless you have anti-lock, not enough to lock your wheels.

It is better to remove as much speed as you can from a possible collision. Then steer around the problem, to the left or right depending on the space available. An emergency like this requires close attention and a quick decision. If you are holding the steering wheel at the recommended 9 and 3 o’clock positions, you can turn it a full 180 degrees very quickly without removing either hand. But you have to act fast, steer quickly, and just as quickly straighten the wheel once you have avoided the object. You must then be prepared to steer back to your original lane and then brake to a controlled stop.

Depending on your speed, this can be rather violent for an unprepared driver. This is one of the reasons driving experts recommend that you use your safety belts and keep both hands on the steering wheel.

The fact that such emergency situations are always possible is a good reason to practice defensive driving at all times.
Off-Road Recovery

You may find sometime that your right wheels have dropped off the edge of a road onto the shoulder while you're driving.

If the level of the shoulder is only slightly below the pavement, recovery should be fairly easy. Ease off the accelerator and then, if there is nothing in the way, steer so that your vehicle straddles the edge of the pavement. You can turn the steering wheel up to \( \frac{1}{4} \) turn until the right front tire contacts the pavement edge. Then turn your steering wheel to go straight down the roadway.

If the shoulder appears to be about four inches (100 mm) or more below the pavement, this difference can cause problems. If there is not enough room to pull entirely onto the shoulder and stop, then follow the same procedures. But if the right front tire scours against the side of the pavement, do not steer more sharply. With too much steering angle, the vehicle may jump back onto the road with so much steering input that it crosses over into the oncoming traffic before you can bring it back under control. Instead, ease off again on the accelerator and steering input, straddle the pavement once more, then try again.

Passing

The driver of a vehicle about to pass another on a two-lane highway waits for just the right moment: accelerates, moves around the vehicle ahead, then goes back into the right lane again. A simple maneuver?

Not necessarily. Passing another vehicle on a two-lane highway is a potentially dangerous move, since the passing vehicle occupies the same lane as oncoming traffic for several seconds. A miscalculation, an error in judgment, or a brief surrender to frustration or anger can suddenly put the passing driver face to face with the worst of all traffic accidents—the head-on collision.

So here are some tips for passing:

- "Drive ahead." Look down the road, to the sides, and to crossroads for situations that might affect your passing patterns. If you have any doubt whatsoever about making a successful pass, wait for a better time.
• Watch for traffic signs, pavement markings, and limits. If you can see a sign up ahead that might indicate a turn or an intersection, delay your pass. A broken center line usually indicates it's all right to pass (providing the road ahead is clear). Never cross a solid line on your side of the lane or a double solid line, even if the road seems empty of approaching traffic.

• If you suspect that the driver of the vehicle you want to pass isn't aware of your presence, tap the horn a couple of times before passing. Or, you can use flash-to-pass. See the Index under Flash-to-Pass.

• Do not get too close to the vehicle you want to pass while you’re awaiting an opportunity. For one thing, following too closely reduces your area of vision, especially if you’re following a larger vehicle. Also, you won’t have adequate space if the vehicle ahead suddenly slows or stops. Keep back a reasonable distance.

• When it looks like a chance to pass is coming up, start to accelerate but stay in the right lane and don’t get too close. Time your move so you will be increasing speed as the time comes to move into the other lane. If the way is clear to pass, you will have a “running start” that more than makes up for the distance you would lose by dropping back. And if something happens to cause you to cancel your pass, you need only slow down and drop back again and wait for another opportunity.

• If other cars are lined up to pass a slow vehicle, wait your turn. But take care that someone isn’t trying to pass you as you pull out to pass the slow vehicle. Remember to glance over your shoulder and check the blind spot.

• Check your mirrors, glance over your shoulder, and start your left lane change signal before moving out of the right lane to pass. When you are far enough ahead of the passed vehicle to see its front in your inside mirror, activate your right lane change signal and move back into the right lane. (Remember that your right outside mirror is convex. The vehicle you just passed may seem to be farther away from you than it really is.)

• Try not to pass more than one vehicle at a time on two-lane roads. Reconsider before passing the next vehicle.

• Don’t overtake a slowly moving vehicle too rapidly. Even though the brake lights are not flashing, it may be slowing down or starting to turn.

• If you’re being passed, make it easy for the following driver to get ahead of you. Perhaps you can ease a little to the right.
Loss of Control

Let's review what driving experts say about what happens when the three control systems (brakes, steering and acceleration) don't have enough friction where the tires meet the road to do what the driver has asked.

In any emergency, don't give up. Keep trying to steer and constantly seek an escape route or area of less danger.

Skidding

In a skid, a driver can lose control of the vehicle. Defensive drivers avoid most skids by taking reasonable care suited to existing conditions, and by not "overdriving" those conditions. But skids are always possible.

The three types of skids correspond to your Oldsmobile's three control systems. In the braking skid your wheels aren't rolling. In the steering or cornering skid, too much speed or steering in a curve causes tires to slip and lose cornering force. And in the acceleration skid too much throttle causes the driving wheels to spin.

A cornering skid and an acceleration skid are best handled by easing your foot off the accelerator pedal. If your vehicle starts to slide (as when you turn a corner on a wet, snow- or ice-covered road), ease your foot off the accelerator pedal as soon as you feel the vehicle start to slide. Quickly steer the way you want the vehicle to go. If you start steering quickly enough, your vehicle will straighten out. As it does, straighten the front wheels.

Of course, traction is reduced when water, snow, ice, gravel, or other material is on the road. For safety, you'll want to slow down and adjust your driving to those conditions. It is important to slow down on slippery surfaces because stopping distance will be longer and vehicle control more limited.

While driving on a surface with reduced traction, try your best to avoid sudden steering, acceleration, or braking (including engine braking by shifting to a lower gear). Any sudden changes could
cause the tires to slide. You may not realize the surface is slippery until your vehicle is sliding. Learn to recognize warning clues—such as enough water, ice or packed snow on the road to make a ‘mirrored surface’—and slow down when you have any doubt.

If you have the anti-lock braking system, remember: It helps avoid only the braking skid. If you do not have anti-lock, then in a braking skid (where the wheels are no longer rolling), release enough pressure on the brakes to get the wheels rolling again. This restores steering control. Push the brake pedal down steadily when you have to stop suddenly. As long as the wheels are rolling, you will have steering control. Steer the way you want to go.

Driving at Night

Night driving is more dangerous than day driving. One reason is that some drivers are likely to be impaired by alcohol or drugs, with night vision problems, or by fatigue.

Here are some tips on night driving:
- Drive defensively. Remember, this is the most dangerous time.
- Don’t drink and drive. (See the Index under Drunken Driving for more on this problem.)
- Adjust your inside rearview mirror to reduce the glare from headlights behind you.
- Since you can’t see as well, you may need to slow down and keep more space between you and other vehicles. It’s hard to tell how fast the vehicle ahead is going just by looking at its taillights.
- Slow down, especially on higher speed roads. Your headlights can light up only so much road ahead.
- In remote areas, watch for animals.
- If you’re tired, pull off the road in a safe place and rest.
Night Vision
No one can see as well at night as in the daytime. But as we get older these differences increase. A 50-year-old driver may require at least twice as much light to see the same thing at night as a 20-year-old.

What you do in the daytime can also affect your night vision. For example, if you spend the day in bright sunshine you are wise to wear sunglasses. Your eyes will have less trouble adjusting to night.

But if you’re driving, don’t wear sunglasses at night. They may cut down on glare from headlights, but they also make a lot of things invisible—such as parked cars, obstacles, pedestrians, or even trains blocking railway crossings. You may want to put on your sunglasses after you have pulled into a brightly-lighted service or refreshment area. Eyes shielded from that glare may adjust more quickly to darkness back on the road. But be sure to remove your sunglasses before you leave the service area.

You can be temporarily blinded by approaching lights. It can take a second or two, or even several seconds, for your eyes to readjust to the dark. When you are faced with severe glare (as from a driver who doesn’t lower the high beams, or a vehicle with misaimed headlights), slow down a little. Avoid staring directly into the approaching lights. If there is a line of opposing traffic, make occasional glances over the line of headlights to make certain that one of the vehicles isn’t starting to move into your lane. Once you are past the bright lights, give your eyes time to readjust before resuming speed.

High Beams
If the vehicle approaching you has its high beams on, signal by flicking yours to high and then back to low beam. This is the usual signal to lower the headlight beams. If the other driver still doesn’t lower the beams, resist the temptation to put your high beams on. This only makes two half-blinded drivers.

On a freeway, use your high beams only in remote areas where you won’t impair approaching drivers. In some places, like cities, using high beams is illegal. When you follow another vehicle on a freeway or highway, use low beams. True, most vehicles now have day-night mirrors that enable the driver to reduce glare. But outside mirrors are not of this type and high beams from behind can bother the driver behind.
A Few More Night Driving Suggestions
Keep your windshield and all the glass on your vehicle clean—inside and out. Glare at night is made much worse by dirt on the glass. Even the inside of the glass can build up a film caused by dust. Tobacco smoke also makes inside glass surfaces very filmy and can be a vision hazard if it’s left there.
Dirty glass makes lights dazzle and flash more than clean glass would, making the pupils of your eyes contract repeatedly. You might even want to keep a cloth and some glass cleaner in your vehicle if you need to clean your glass frequently.

Remember that your headlights light up far less of a roadway when you are in a turn or curve.

Keep your eyes moving. That way, it’s easier to pick out dimly lighted objects. Just as your headlights should be checked regularly for proper aim, so should your eyes be examined regularly. Some drivers suffer from night blindness—the inability to see in dim light—and aren’t even aware of it.

Driving in the Rain
Rain and wet roads can mean driving trouble. On a wet road you can’t stop, accelerate or turn as well because your tire-to-road traction isn’t as good as on dry roads. And, if your tires don’t have much tread left, you’ll get even less traction.

It’s always wise to go slower and be cautious if rain starts to fall while you are driving. The surface may get wet suddenly when your reflexes are tuned for driving on dry pavement.

The heavier the rain, the harder it is to see. Even if your windshield wipers blades are in good shape, a heavy rain can make it harder to see road signs and traffic signals, pavement markings, the edge of the road, and even people.
Driving in the Rain (CONT.)

Walking. Road spray can often be worse for vision than rain, especially if it comes from a dirty road.
So it is wise to keep your wiping equipment in good shape and keep your windshield washer tank filled. Replace your windshield wiper inserts when they show signs of streaking or missing areas on the windshield, or when strips of rubber start to separate from the inserts.

CAUTION

Driving too fast through large water puddles or even going through some car washes can cause problems, too. The water may affect your brakes. Try to avoid puddles. But if you can't, try to slow down before you hit them.

I CAUTION

Driving too fast through large water puddles or even going through some car washes can cause problems, too. The water may affect your brakes. Try to avoid puddles. But if you can't, try to slow down before you hit them.

Wet brakes can cause accidents. They won't work well in a quick stop and may cause pulling to one side. You could lose control of the vehicle.
After driving through a large puddle of water or a car wash, apply your brake pedal lightly until your brakes work normally.
Hydroplaning

Hydroplaning is dangerous. So much water can build up under your tires that they can actually ride on the water. This can happen if the road is wet enough and you're going fast enough. When your vehicle is hydroplaning, it has little or no contact with the road. You might not be aware of hydroplaning. You could drive along for some time without realizing your tires aren't in constant contact with the road. You could find out the hard way; when you have to slow, turn, move out to pass—or if you get hit by a gust of wind. You could suddenly find yourself out of control.

Hydroplaning doesn't happen often. But it can if your tires haven't much tread or if the pressure in one or more is low. It can happen if a lot of water is standing on the road. If you can see reflections from trees, telephone poles, or other vehicles, and ripples or “dimples” in the water's surface, there could be hydroplaning.

Hydroplaning usually happens at higher speeds. There just isn't a hard and fast rule about hydroplaning. The best advice is to slow down when it is raining, and be careful.

Some Other Rainy Weather Tips

- Turn on your headlights—not just your parking lights—to help make you more visible to others.
- Look for hard-to-see vehicles coming from behind. You may want to use your headlights even in daytime if it's raining hard.
- Besides slowing down, allow some extra following distance. And be especially careful when you pass another vehicle. Allow yourself more clear room ahead, and be prepared to have your view restricted by road spray. If the road spray is so heavy you are actually blinded, drop back. Don't pass until conditions improve. Going more slowly is better than having an accident.
- Use your defogger if it helps.
- Have good tires with proper tread depth. (See the Index under Tires.)
Driving in Fog, Mist and Haze

Fog can occur with high humidity or heavy frost. It can be so thick that you can see through it for several hundred feet (meters). Or it might be so thin that you can see only a few feet (meters) ahead. It may come suddenly, so you must be alert for an otherwise clear road. And it can be a major hazard.

When you drive into a fog patch, your visibility is reduced quickly. The biggest dangers are striking the vehicle ahead or being struck by the one behind. Try to "read" the fog density and speed down the road. If the vehicle ahead starts to become less clear or, at night, if the taillights are harder to see, the fog is probably thickening. Slow down to give traffic behind you a chance to slow down.

Everybody then has a better chance to avoid hitting the vehicle ahead.

A patch of dense fog may extend only for a few feet (meters) or for miles (kilometers); you can’t really tell while you’re in it. You can only treat the situation with extreme care.

One common fog condition—sometimes called mirage or ground fog—can happen in weather that seems perfect, especially at night or in the early morning in valley and low, marshy areas. You can be suddenly enveloped in thick, wet haze that may even coat your windshield. You can often spot these fog patches or mist layers with your headlights. But sometimes they can be waiting for you as you come over a hill or dip into a shallow valley. Start your windshield wipers and washer to help clear accumulated mud and dirt. Slow down carefully.

Tips on Driving in Fog

If you get caught in fog, turn your headlights on low beam, even in daytime. You’ll see—and be seen—better. Use your fog lights.

Don’t use your high beams. The light will bounce off the water droplets that make up fog and reflect back at you.

Use your defogger. In high humidity, even a light build-up of moisture on the inside of the glass will cut down on your already limited visibility. Run your windshield wipers and washer occasionally. Moisture can build up on the outside glass, and what seems to be fog may actually be moisture on the outside of your windshield.

Treat dense fog as an emergency. Try to find a place to pull off the road. Of course you want to respect another’s property, but you might need to pull something between you and moving vehicles.
City Driving

One of the biggest problems with city streets is the amount of traffic on them. You'll want to watch out for what the other drivers are doing and pay attention to traffic signals.

Here are ways to increase your safety in city driving:

- Know the best way to get to where you are going. Try not to drive around trying to pick out a familiar street or landmark. Get a city map and plan your trip into an unknown part of the city just as you would for a cross-country trip.
- Try to use the freeways that rim and cross over most large cities. You'll save time and energy. (See the next section, Freeway Driving.)
- Treat a green light as a warning signal. A traffic light is there because the corner is busy enough to need it. When a light turns green, and just before you start to move, check both ways for vehicles that have not cleared the intersection or may be running the red light.
- Obey all posted speed limits. But remember that they are for ideal road, weather, and visibility conditions. You may need to drive below the posted limit in bad weather or when visibility is especially poor.
- Pull to the right (with care) and stop clear of intersections when you see or hear emergency vehicles.
Freeway Driving

Mile for mile, freeways (also called thruways, parkways, expressways, turnpikes, or superhighways) are the safest of all roads. But they have their own special rules.

The most important advice on freeway driving is: Keep up with traffic and keep to the right. Drive at the same speed most of the other drivers are driving. Too-fast or too-slow driving breaks a smooth traffic flow. Treat the left lane on a freeway as a passing lane.

Entering the Freeway

At the entrance there is usually a ramp that leads to the freeway. If you have a clear view of the freeway as you drive along the entrance ramp, you should begin to check traffic. Try to determine where you expect to blend with the flow. If traffic is light, you may have no problem. But if it is heavy, find a gap as you move along the entering lane and time your approach. Try to merge into the gap at close to the prevailing speed. Switch on your turn signal, check your rearview mirrors as you move along, and glance over your shoulder as often as necessary. Try to blend smoothly with the traffic flow.

Driving on the Freeway

Once you are on the freeway, adjust your speed to the posted limit or to the prevailing rate if it's slower. Stay in the right lane unless you want to pass. If you are on a two-lane freeway, treat the right lane as the slow lane and the left lane as the passing lane.

If you are on a three-lane freeway, treat the right lane as the slower-speed through lane, the middle lane as the higher-speed through lane, and the left lane as the passing lane.

Before changing lanes, check your rearview mirrors. Then use your turn signal. Just before you leave the lane, glance quickly over your shoulder to make sure there isn’t another vehicle in your “blind” spot.
If you are moving from an outside to a center lane on a freeway having more than two lanes, make sure another vehicle isn't about to move into the same spot. Look at the vehicles two lanes over and watch for telltale signs: turn signals flashing, an increase in speed, or moving toward the edge of the lane. Be prepared to delay your move.

Once you are moving on the freeway, make certain you allow a reasonable following distance. Expect to move slightly slower at night.

**Leaving the Freeway**

When you want to leave the freeway, move to the proper lane well in advance. Dashing across lanes at the last minute is dangerous. If you miss your exit do not, under any circumstances, stop and back up. Drive on to the next exit.

At each exit point is a deceleration lane. Ideally it should be long enough for you to enter it at freeway speed (after signaling, of course) and then do your braking before moving onto the exit ramp. Unfortunately, not all deceleration lanes are long enough—some are too short for all the braking. Decide when to start braking. If you must brake on the through lane, and if there is traffic close behind you, you can allow a little extra time and flash your brake lights (in addition to your turn signal) as extra warning that you are about to slow down and exit.

The exit ramp can be curved, sometimes quite sharply. The exit speed is usually posted. Reduce your speed according to your speedometer, not to your sense of motion. After driving for any distance at higher speeds, you may tend to think you are going slower than you actually are. For example, 40 mph (65 km/h) might seem like only 20 mph (30 km/h).

Obviously, this could lead to serious trouble on a ramp designed for 20 mph (30 km/h)!
Driving a Long Distance
Although most long trips today are made on freeways, there are still many made on regular highways.
Long-distance driving on freeways and regular highways is the same in some ways. The trip has to be planned and the vehicle prepared, you drive at higher-than-city speeds, and there are longer turns behind the wheel. You'll enjoy your trip more if you and your vehicle are in good shape. Here are some tips for a successful long trip.

Before Leaving on a Long Trip
Make sure you're ready. Try to be well rested. If you must start when you're not fresh—such as after a day's work—don't plan to make too many miles that first part of the journey. Wear comfortable clothing and shoes you can easily drive in.
Is your vehicle ready for a long trip? If you keep it serviced and maintained, it's ready to go. If it needs service, have it done before starting out. Of course, you'll find experienced and able service experts in Oldsmobile dealerships all across North America. They'll be ready and willing to help if you need it.
Here are some things you can check before a trip:

- **Windshield Washer Fluid**: Is the reservoir full? Are all windows clean inside and outside?
- **Wiper Blades**: Are they in good shape?
- **Fuel, Engine Oil, Other Fluids**: Have you checked all levels?
- **Lights**: Are they all working? Are the lenses clean?
- **Tires**: They are vitally important to a safe, trouble-free trip. Is the tread good enough for long-distance driving? Are the tires all inflated to the recommended pressure?
- **Weather Forecasts**: What's the weather outlook along your route? Should you delay your trip a short time to avoid a major storm system?
- **Maps**: Do you have up-to-date maps?
On the Road

Unless you are the only driver, it is good to share the driving task with others. Limit turns behind the wheel to about 100 miles (160 km) or two hours at a sitting. Then, either change drivers or stop for some refreshment like coffee, tea or soft drinks and some limbering up. But do stop and move around. Eat lightly along the way. Heavier meals tend to make some people sleepy.

On two-lane highways or undivided multilane highways that do not have controlled access, you’ll want to watch for some situations not usually found on freeways. Examples are: stop signs and signals, shopping centers with direct access to the highway, no passing zones and school zones, vehicles turning left and right off the road, pedestrians, cyclists, parked vehicles, and even animals.

Highway Hypnosis

Is there actually such a condition as “highway hypnosis”? Or is it just plain falling asleep at the wheel? Call it “highway hypnosis,” lack of awareness, or whatever.

There is something about an easy stretch of road with the same scenery, along with the hum of the tires on the road, the drone of the engine, and the rush of the wind against the vehicle that can make you sleepy. Don’t let it happen to you! If it does, your vehicle can leave the road in less than a second, and you could crash and be injured.

What can you do about highway hypnosis? First, be aware that it can happen.

Then here are some tips:

- Keep your eyes moving. Scan the road ahead and to the sides. Check your rearview mirrors frequently and try to see your instruments from time to time. This can help keep you awake.
- Wear dark sunglasses in bright light. Glare can cause drowsiness, but don’t wear sunglasses at night. They will drastically reduce your overall vision at the very time you need all the seeing power you have.
- If you get sleepy, pull off the road into a rest, service, or parking area and take a nap, get some exercise, or both. For safety’s sake, treat drowsiness on the highway as an emergency.

As in any driving situation, keep pace with traffic and allow adequate following distances.
Hill and Mountain Roads
Driving on steep hills or mountains is different from driving in flat or rolling terrain. If you drive regularly in steep country, or if you're planning to visit there, here are some tips that can make your trips safer and more enjoyable.

1. Keep your vehicle in good shape. Check all fluid levels and also the brakes, tires, cooling system and transaxle. These parts can work hard on mountain roads.
2. Know how to go down hills. The most important thing to know is this: let your engine do some of the slowing down. Don't make your brakes do it all. Shift to a lower gear when you go down a steep or long hill. That way, you will slow down without excessive use of your brakes.

CAUTION
If you don't shift down, your brakes could get so hot that they wouldn't work well. You would then have poor braking or even none going down a hill. You could crash. Shift down to let your engine assist your brakes on a steep downhill slope.

CAUTION
Coasting downhill in N (Neutral) or with the ignition off is dangerous. Your brakes will have to do all the work of slowing down. They could get so hot that they wouldn't work well. You could crash. Always have your engine running and your vehicle in gear when you go downhill.

• Know how to go uphill. You may want to shift down to a lower gear. The lower gears help cool your engine and transaxle, and you can climb the hill better.

• Stay in your own lane when driving on two-lane roads in hills or mountains. Don't swing wide or cut across the center of the road. Drive at speeds that let you stay in your own lane. That way, you won't be surprised by a vehicle coming toward you in the same lane.

• It takes longer to pass another vehicle when you're going uphill. You'll want to leave extra room to pass. If a vehicle is passing you and doesn't have enough room, slow down to make it easier for the other vehicle to get by.
As you go over the top of a hill, be alert. There could be something in your lane, like a stalled car or an accident.

You may see highway signs on mountains that warn of special problems. Examples are long grades, passing or no passing zones, a falling rocks area, or winding roads. Be alert to these and take appropriate action.

Winter driving can present special problems. See the index under Winter Driving.

**Parking on Hills**

Hills and mountains mean spectacular scenery. But please be careful where you stop if you decide to look at the view or take pictures. Look for pull-offs or parking areas provided for scenic viewing.

Another part of this manual tells how to use your parking brake (see the index under Parking Brake). But on a mountain or steep hill, you can do one more thing. You can turn your front wheels to keep your vehicle from rolling downhill or out into traffic. Here's how:

**Parking Downhill**

Turn your wheels to the right. You don't have to jam your tires against the curb, if there is a curb. A gentle contact is all you need.
Parking on Hills (CONT.)

Parking Uphill
If there is a curb, turn your wheels to the left if the curb is at the right side of your vehicle.

If you're going uphill on a one-way street and you're parking on the left side, your wheels should point to the right.

If there is no curb when you're parking uphill, turn the wheels to the right.
If there is no curb when you're parking uphill on the left side of a one-way street, your wheels would be turned to the left.
**Torque Lock**

If you are parking on a hill and you don't shift your transaxle into P (Park) properly, the weight of the vehicle may put too much force on the parking pawl in the transaxle. You may find it difficult to pull the shift lever out of P (Park). This is called "torque lock." To prevent torque lock, always be sure to shift into P (Park) properly before you leave the driver's seat. To find out how, see the Index under Shifting Into P (Park).

When you are ready to drive, move the shift lever out of P (Park) before you release the parking brake.

If "torque lock" does occur, you may need to have another vehicle push yours a little uphill to take some of the pressure from the transaxle, so you can pull the shift lever out of P (Park).

**Winter Driving**

Here are some tips for winter driving:

- Have your Oldsmobile in good shape for winter. Be sure your engine coolant mix is correct.

- Snow tires can help in loose snow, but they may give you less traction on ice than regular tires. If you do not expect to be driving in deep snow, but may have to travel over ice, you may not want to switch to snow tires at all.

- You may want to put winter emergency supplies in your trunk. Include an ice scraper, a small brush or broom, a supply of windshield washer fluid, a rag, some winter outer clothing, a small shovel, a flashlight, a red cloth, and a couple of reflective warning triangles. And, if you will be driving under severe conditions, include a small bag of sand, a piece of old carpet or a couple of burlap bags to help provide traction. Be sure you properly secure these items in your vehicle.
Your Driving and the Road

Driving on Snow or Ice

Most of the time, those places where your tires meet the road probably have good traction.

However, if there is snow or ice between your tires and the road, you can have a very slippery situation.

You'll have a lot less traction or "grip" and must be very careful.

What's the worst time for this? "Wet ice." Very cold snow or ice can be slick and hard to drive on. Wet ice can be even more trouble because it may offer the least traction of all. You can get "wet ice" when it's about freezing (32°F, 0°C) and freezing rain begins to fall. Try to avoid driving on wet ice until salt and sand crews can get there.

Whatever the condition—smooth ice, packed, blowing or loose snow—drive with caution. Accelerate gently. Try not to break the fragile traction. If you accelerate too fast, the drive wheels will spin and polish the surface under the tires even more.

Unless you have the anti-lock braking system, you'll want to brake very gently, too. (If you do have anti-lock, see the Index under Anti-Lock Brake System.) This system improves your vehicle's ability to make a hard stop on a slippery road. Whether you have the anti-lock braking system or not, you'll want to begin stopping sooner than you would on dry pavement. Without anti-lock brakes, if you feel your vehicle begin to slide, let up on the brakes a little. Push the brake pedal down steadily to get the most traction you can.

Remember, unless you have anti-lock, if you brake so hard that your wheels stop rolling, you'll just slide. Brake so your wheels always keep rolling and you can still steer.

• Whatever your braking system, allow greater following distance on any slippery road.

• Watch for slippery spots. The road might be fine until you hit a spot that's covered with ice. On an otherwise clear road, ice patches may appear in shaded areas where the sun can't reach. Around clumps of trees, behind buildings, or under bridges. Sometimes the surface of a curve or an overpass may remain icy when the surrounding roads are clear. If you see a patch of ice ahead of you, brake before you are on it. Try not to brake while you're actually on the ice, and avoid sudden steering maneuvers.
If You’re Caught in a Blizzard

If you are stopped by heavy snow, you could be in a serious situation. You should probably stay with your vehicle unless you know for sure that you are near help and you can hike through the snow. Here are some things to do to summon help and keep yourself and your passengers safe:

- Turn on your hazard flashers.
- Tie a red cloth to your vehicle to alert police that you’ve been stopped by the snow.
- Put on extra clothing or wrap a blanket around you. If you have no blankets or extra clothing, make body insulators from newspapers, burlap bags, rags, floor mats—anything you can wrap around yourself or tuck under your clothing to keep warm.
- You can run the engine to keep warm, but be careful.

**CAUTION**

Snow can trap exhaust gases under your vehicle. This can cause deadly CO (carbon monoxide) gas to get inside. CO could overcome you and kill you. You can’t see it or smell it, so you might not know it was in your vehicle. Clear away snow from around the base of your vehicle, especially any that is blocking your exhaust pipe. And check around again from time to time to be sure snow doesn’t collect there.

Open a window just a little on the side of the vehicle that’s away from the wind. This will help keep CO out.
If You're Caught in a Blizzard (CONT.)

Run your engine only as long as you must. This saves fuel. When you run the engine, make it go a little faster than just idle. That is, push the accelerator slightly. This uses less fuel for the heat that you get and it keeps the battery charged. You will need a well-charged battery to restart the vehicle and possibly for signaling later on with your headlights. Let the heater run for a while.

Then, shut the engine off and close the window almost all the way to preserve the heat. Start the engine again and repeat this only when you feel really uncomfortable from the cold. But do it as little as possible. Preserve the fuel as long as you can.

To help keep warm, you can get out of the vehicle and do some fairly vigorous exercises every half-hour or so until help comes.

If You're Stuck in Deep Snow

This manual explains how to get the vehicle out of deep snow without damaging it. See the Index under Rocking Your Vehicle.

Towing a Trailer

**CAUTION**

If you don't use the correct equipment and drive properly, you can lose control when you pull a trailer. For example, if the trailer is too heavy, the brakes may not work well—or even at all. You and your passengers could be seriously injured. Pull a trailer only if you have followed all the steps in this section.

**NOTICE**

Pulling a trailer improperly can damage your vehicle and result in costly repairs not covered by your warranty. To pull a trailer correctly, follow the advice in this section.
Do not tow a trailer if you have a convertible with the 3.4L VIN Code X engine.

Your Oldsmobile can tow a trailer. To identify what the vehicle trailering capacity is for your vehicle, you should read the information in Weight of the Trailer that appears later in this section. But towing is different than just driving your vehicle by itself. Trailering means changes in handling, durability, and fuel economy. Successful, safe towing takes correct equipment, and it has to be used properly.

That's the reason for this section. In it are many time-tested, important towing tips and safety rules. Many of these are important for your safety and that of your passengers. So please read this section carefully before you pull a trailer.

Load-pulling components such as the engine, transaxle, wheel assemblies, and tires are forced to work harder against the drag of the added weight. The engine is required to operate at relatively higher speeds and under greater loads, generating extra heat. What's more, the trailer adds considerably to wind resistance, increasing the pulling requirements. All of that means changes in:

- Handling
- Durability
- Fuel economy

If You Do Decide to Pull a Trailer

If you do, here are some important points:

- There are many different laws having to do with towing. Make sure your rig will be legal, not only where you live but also where you'll be driving. A good source for this information can be state or provincial police.
- Consider using a sway control. You can ask a hitch dealer about sway controls.
- Don't tow a trailer at all during the first 500 miles (800 km) your new vehicle is driven. Your engine, axle, or other parts could be damaged.
### Your Driving and the Road

#### If You Do Decide to Pull a Trailer (CONT.)
- Then, during the first 500 miles (800 km) that you tow a trailer, don't drive over 50 mph (80 km/h) and don't make starts at full throttle. This helps your engine and other parts of your vehicle wear in at the heavier loads.
- Three important considerations have to do with weight:
  - Weight of the Trailer
    - How heavy can a trailer safely be? It should never weigh more than 1,000 pounds (450 kg), unless you have a 3.1L V6 with the heavy-duty cooling package. Then your vehicle can tow up to 2,000 pounds (900 kg). But even that can be too heavy. It depends on how you plan to use your rig. For example, speed, altitude, road grades, outside temperature and how much your vehicle is used to pull a trailer are all important. And, it can also depend on any special equipment that you have on your vehicle. You can ask your dealer for our trailer information or advice, or you can write us at:

**Weight of the Trailer**

&emsp;&emsp;How heavy can a trailer safely be? It should never weigh more than 1,000 pounds (450 kg), unless you have a 3.1L V6 with the heavy-duty cooling package. Then your vehicle can tow up to 2,000 pounds (900 kg). But even that can be too heavy. It depends on how you plan to use your rig. For example, speed, altitude, road grades, outside temperature and how much your vehicle is used to pull a trailer are all important. And, it can also depend on any special equipment that you have on your vehicle. You can ask your dealer for our trailer information or advice, or you can write us at:
Weight of the Trailer Tongue
The tongue load (A) of any trailer is an important weight to measure because it affects the total capacity weight of your vehicle. The capacity weight includes the curb weight of the vehicle, any cargo you may carry in it, and the people who will be riding in the vehicle. And if you will tow a trailer, you must subtract the tongue load from your vehicle's capacity weight because your vehicle will be carrying that weight, too. See the Index under Loading Your Vehicle for more information about your vehicle's maximum load capacity.

The trailer tongue (A) should weigh 10% of the total loaded trailer weight (B). After you've loaded your trailer, weigh the trailer and then the tongue, separately, to see if the weights are proper. If they aren't, you may be able to get them right simply by moving some items around in the trailer.

Total Weight on Your Vehicle's Tires
Be sure your vehicle's tires are inflated to the limit for cold tires. You will find these numbers on the Certification label at the rear edge of the driver's door or on the inside of the trunk lid. See the Index under Tire Loading.

Hitches
It's important to have the correct hitch equipment. Crosswinds, large trucks going by, and rough roads are a few reasons why you'll need the right hitch. Here are some rules to follow:

• Will you have to make any holes in the body of your vehicle when you install a trailer hitch? If you do, then be sure to seal the holes later when you remove the hitch. If you don't seal them, deadly carbon monoxide (CO) from your exhaust can get into your vehicle. (See the Index under Carbon Monoxide in Exhaust.) Dirt and water can, too.
If You Do Decide to Pull a Trailer (CONT.)

- The bumpers on your vehicle are not intended for hitches. Do not attach rental hitches or other bumper-type hitches to them. Use only a frame-mounted hitch that does not attach to the bumper.

Safety Chains
You should always attach chains between your vehicle and your trailer. Cross the safety chains under the tongue of the trailer so that the tongue will not drop to the road if it becomes separated from the hitch. Instructions about safety chains may be provided by the hitch manufacturer or by the trailer manufacturer. Follow the manufacturer’s recommendation for attaching safety chains. Always leave just enough slack so you can turn with your rig. And, never allow safety chains to drag on the ground.

Trailer Brakes
If your trailer weighs more than 1,000 pounds (450 kg) loaded, then it needs its own brakes—and they must be adequate.

Be sure to read and follow the instructions for the trailer brakes so you’ll be able to install, adjust and maintain them properly.

- If your vehicle has anti-lock brakes, do not try to tap into your vehicle’s brake system. If you do, both brake systems won’t work well, or at all.
- Even if your vehicle doesn’t have anti-lock brakes, don’t tap into your vehicle’s brake system if the trailer’s brake system will use more than 0.02 cubic inch (0.3 cc) of fluid from your
Driving with a Trailer

Towing a trailer requires a certain amount of experience. Before setting out on the open road, you'll want to get to know your rig. Acquaint yourself with the feel of handling and braking with the added weight of the trailer. Always keep in mind that the vehicle you are driving is now a good deal longer and not nearly as responsive as your vehicle is by itself.

Before you start, check the trailer hitch and platform, safety chains, electrical connection, lights, tires and mirror adjustment. If the trailer has electric brakes, start your vehicle and trailer moving and then apply the trailer brake controller by hand to be sure the brakes are working. This lets you check your electrical connection at the same time. During your trip, check occasionally to be sure that the load is secure, and that the lights and any trailer brakes are still working.

Following Distance

Stay at least twice as far behind the vehicle ahead as you would when driving your vehicle without a trailer. This can help you avoid situations that require heavy braking and sudden turns.

Passing

You'll need more passing distance up ahead when you're towing a trailer. And, because you're a good deal longer, you'll need to go much farther beyond the passed vehicle before you can return to your lane.

Backing Up

Hold the bottom of the steering wheel with one hand. Then, to move the trailer to the left, just move that hand to the left. To move the trailer to the right, move your hand to the right. Always back up slowly and, if possible, have someone guide you.
Driving with a Trailer (CONT.)

Making Turns
When you're turning with a trailer, make wider turns than normal. Do this so your trailer won't strike soft shoulders, curbs, road signs, trees, or other objects. Avoid jerky or sudden maneuvers. Signal well in advance.

Turn Signals When Towing a Trailer
When you tow a trailer, your vehicle has to have a different turn signal flasher and extra wiring. The green arrows on your instrument panel will flash whenever you signal a turn or lane change. Properly hooked up, the trailer lights will also flash, telling other drivers you're about to turn, change lanes or stop.

When towing a trailer, the green arrows on your instrument panel will flash for turns even if the bulbs on the trailer are burned out. Thus, you may think drivers behind you are seeing your signal when they are not. It's important to check occasionally to be sure the trailer bulbs are still working.

Driving On Grades
Reduce speed and shift to a lower gear before you start down a long or steep downgrade. If you don't shift down, you might have to use your brakes so much that they would get hot and no longer work well.

On a long uphill grade, shift down and reduce your speed to around 45 mph (70 km/h) to reduce the possibility of engine and transaxle overheating.

If you are towing a trailer and you have an automatic transaxle with Overdrive, you may want to drive in D instead of (or, as you need to, a lower gear).
Parking on Hills
You really should not park your vehicle, with a trailer attached, on a hill. If something goes wrong, your rig could start to move. People can be injured, and both your vehicle and the trailer can be damaged.

But if you ever have to park your rig on a hill, here’s how to do it:

1. Apply your regular brakes, but don’t shift into P (Park) yet.
2. Have someone place chocks under the trailer wheels.
3. When the wheel chocks are in place, release the regular brakes until the chocks absorb the load.
4. Reapply the regular brakes. Then apply your parking brake, and then shift to P (Park).
5. Release the regular brakes.

When You Are Ready to Leave After Parking on a Hill
1. Apply your regular brakes and hold the pedal down while you:
   * Start your engine;
   * Shift into a gear; and
   * Release the parking brake.
2. Let up on the brake pedal.
3. Drive slowly until the trailer is clear of the chocks.
4. Stop and have someone pick up and store the chocks.

Maintenance When Trailer Towing
Your vehicle will need service more often when you’re pulling a trailer. See the Maintenance Schedule for more on this. Things that are especially important in trailer operation are automatic transaxle fluid (don’t overfill), engine oil, belts, cooling system, and brake adjustment. Each of these is covered in this manual, and the Index will help you find them quickly. If you’re trailerin, it’s a good idea to review these sections before you start your trip.

Check periodically to see that all hitch nuts and bolts are tight.
Here you'll find what to do about some problems that can occur on the road.

Problems on the Road

Hazard Warning Flashers
Your hazard warning flashers let you warn others. They also let police know you have a problem. Your front and rear turn signal lights will flash on and off.

Slide the switch up to make your front and rear turn signal lights flash on and off.

Your hazard warning flashers work no matter what position your key is in, and even if the key isn't in.

To turn off the flashers, slide the switch down.

When the hazard warning flashers are on, your turn signals won't work.

Other Warning Devices
If you carry reflective triangles, you can set one up at the side of the road about 300 feet (100 m) behind your vehicle.
Jump Starting

If your battery has run down, you may want to use another vehicle and some jumper cables to start your Oldsmobile. But please follow the steps here to do it safely.

**CAUTION**

Batteries can hurt you. They can be dangerous because:

- They contain acid that can burn you.
- They contain gas that can explode or ignite.
- They contain enough electricity to burn you.

If you don't follow these steps exactly, some or all of these things can hurt you.

**NOTICE**

Ignoring these steps could result in costly damage to your vehicle that wouldn't be covered by your warranty.

Try to start your Oldsmobile by pushing or pulling it won't work, and it could damage your vehicle.

To Jump Start Your Oldsmobile:

1. Check the other vehicle. It must have a 12-volt battery with a negative ground system.

**NOTICE**

If the other system isn't a 12-volt system with a negative ground, both vehicles can be damaged.
Jump Starting (cont.)

2. Get the vehicles close enough so the jumper cables can reach, but be sure the vehicles aren’t touching each other. If they are, it could cause a ground connection you don’t want. You wouldn’t be able to start your Oldsmobile, and the bad grounding could damage the electrical systems.

**CAUTION**

You could be injured if the vehicles roll. Set the parking brake firmly on each vehicle. Put an automatic transaxle in P (Park) or a manual transaxle in N (Neutral).

3. Turn off the ignition on both vehicles. Turn off all lights that aren’t needed, and radios. This will avoid sparks and help save both batteries. And it could save your radio!

**NOTICE**

If you leave your radio on, it could be badly damaged. The repairs wouldn’t be covered by your warranty.

4. Open the hoods and locate the batteries.

**CAUTION**

An electric fan can start up even when the engine is not running and can injure you. Keep hands, clothing and tools away from any underhood electric fan.

Find the positive (+) and negative (−) terminals on each battery. Your Oldsmobile has a remote positive (+) jump starting terminal. The terminal is on the same side of the engine compartment as your battery.

You should always use the remote positive (+) terminal instead of the positive (+) terminal on your battery. To uncover the remote positive (+) terminal, lift the red plastic cap.
Using a match near a battery can cause battery gas to explode. People have been hurt doing this, and some have been blinded. Use a flashlight if you need more light. Be sure the battery has enough water.

You don't need to add water to the Delco Freedom® battery installed in every new GM vehicle. But if a battery has filler caps, be sure the right amount of fluid is there. If it is low, add water to take care of that first. If you don't, explosive gas could be present.

Battery fluid contains acid that can burn you. Don't get it on you. If you accidentally get it in your eyes or on your skin, flush the place with water and get medical help immediately.

CAUTION

5. Check that the jumper cables don't have loose or missing insulation. If they do, you could get a shock. The vehicles could be damaged, too.

Before you connect the cables, here are some things you should know. Positive (+) will go to positive (+) and negative (-) will go to negative (-) or a metal engine part. Don't connect (+) to (-) or you'll get a short that would damage the battery and maybe other parts, too.

6. Connect the red positive (+) cable to the positive (+) terminal of the vehicle with the dead battery.

Use a remote positive (+) terminal if the vehicle has one.
Problems on the Road

Jump Starting (cont.)

7. Don't let the other end touch metal. Connect it to the positive (+) terminal of the good battery. Use a remote positive (+) terminal if the vehicle has one.

8. Now connect the black negative (-) cable to the good battery's negative (-) terminal. Don't let the other end touch anything until the next step. The other end of the negative cable doesn't go to the dead battery. It goes to a heavy unpainted metal part on the engine of the vehicle with the dead battery.

9. Attach the cable at least 18 inches (45 cm) away from the dead battery, but not near engine parts that move. The electrical connection is just as good there, but the chance of sparks getting back to the battery is much less.

10. Now start the vehicle with the good battery and run the engine for a while.

11. Try to start the vehicle with the dead battery. If it won't start after a few tries, it probably needs service.

12. Remove the cables in reverse order to prevent electrical shorting. Take care that they don't touch each other or any metal.
Towing Your Oldsmobile

Try to have a GM dealer or a professional towing service tow your Oldsmobile. The usual towing equipment is:

(A) Sling-type tow truck
(B) Wheel-lift tow truck
(C) Car carrier

If your vehicle has been changed or modified since it was factory-new by adding aftermarket items like fog lamps, aero skirts, or special tires and wheels, these instructions and illustrations may not be correct.

Before you do anything, turn on the hazard warning flashers.

When you call, tell the towing service:
- That if you have the 4-door “I” series, or a 2-door Oldsmobile, your vehicle cannot be towed from the front with sling-type equipment.
- That your vehicle has front-wheel drive.
- The make, model, and year of your vehicle.
- Whether you can still move the shift lever.
- If there was an accident, what was damaged.

When the towing service arrives, let the tow operator know that this manual contains detailed towing instructions and illustrations. The operator may want to see them.

CAUTION

To help avoid injury to you or others:
- Never let passengers ride in a vehicle that is being towed.
- Never tow faster than safe or posted speeds.
- Never tow with damaged parts not fully secured.
- Never get under your vehicle after it has been lifted by the tow truck.
- Always use separate safety chains on each side when towing a vehicle.
- Never use “J” hooks. Use T-hooks instead.
Towing Your Oldsmobile (cont.)

When your vehicle is being towed, have the ignition key off. The steering wheel should be clamped in a straight-ahead position, with a clamping device designed for towing service. Do not use the vehicle's steering column lock for this. The transaxle should be in N (Neutral), and the parking brake released.

Don't have your vehicle towed on the front wheels, unless you must. If the vehicle must be towed on the front wheels, don't go more than 35 mph (56 km/h) or farther than 50 miles (80 km) or your transaxle will be damaged. If these limits must be exceeded, then the front wheels have to be supported on a dolly.

CAUTION

A vehicle can fall from a car carrier if it isn't properly secured. This can cause a collision, serious personal injury and vehicle damage. The vehicle should be tightly secured with chains or steel cables before it is transported.

Don't use substitutes (ropes, leather straps, canvas webbing, etc.) that can be cut by sharp edges underneath the towed vehicle.

Towing from the Front—Vehicle Hook-up

Before hooking up to a tow truck, be sure to read all the information on Towing Your Oldsmobile earlier in this section.

All Models

1. Attach T-hook chains into the side slots in the cradle in front of the wheels, on both sides.
4-Door, except I-Series

2. Position a 4x4 wood beam across sling chains against the bottom of the cradle horns.

2-Doors and I-Series, 4-Door

**NOTICE**

Do not tow with sling-type equipment or fascia/fog light damage will occur.
Use wheel-lift or car carrier equipment. Additional ramping may be required for car carrier equipment.
Use safety chains and wheel straps.

**NOTICE**

To help avoid damaging a vehicle during a tow over rough surfaces, install a towing dolly beneath the wheels that would otherwise be on the ground during the tow. This will increase clearance between the wheel lift equipment and the underbody of the towed vehicle.
Problems on the Road

Towing from the Front—Vehicle Hook-up (CONT.)

All Models

3. Attach a separate safety chain around the middle end of each lower control arm.

Towing from the Rear—Vehicle Hook-up

Before hooking up to a tow truck, be sure to read all the information on Towing Your Oldsmobile earlier in this section.

1. Attach T-hook chains on both sides in the slotted holes in the bottom of the floor pan support rails just ahead of the rear wheels.

2. Position the lower sling crossbar just ahead of the rear bumper.

Dual Exhausts

If your vehicle is equipped with dual exhausts, center the sling between exhaust pipes.
3. Attach a separate safety chain around the outboard end of each lower control arm.

**Engine Overheating**

You will find a coolant temperature gage or the warning light about a hot engine on your Oldsmobile's instrument panel. You also have a low coolant warning light on your instrument panel. See the Index under Coolant Temperature Gage for the gage cluster.

**NOTICE**

If your engine catches fire because you keep driving with no coolant, your vehicle can be badly damaged. The costly repairs would not be covered by your warranty.

If steam is coming from your engine:

**CAUTION**

Steam from an overheated engine can burn you badly, even if you just open the hood. Stay away from the engine if you see or hear steam coming from it. Just turn it off and get everyone away from the vehicle until it cools down. Wait until there is no sign of steam or coolant before opening the hood. If you keep driving when your engine is overheated, the liquids in it can catch fire. You or others could be badly burned. Stop your engine if it overheats, and get out of the vehicle until the engine is cool.
**Engine Overheating (CONT.)**

If No Steam is Coming from Your Engine:

If you get the overheat warning but see or hear no steam, the problem may not be too serious. Sometimes the engine can get a little too hot when you:
- Climb a long hill on a hot day.
- Stop after high speed driving.
- Idle for long periods in traffic.
- Tow a trailer.

If you get the overheat warning with no sign of steam, try this for a minute or so:

1. Turn off your air conditioner.
2. Turn on your heater to full hot at the highest fan speed and open the window as necessary.
3. Try to keep your engine under load (in a drive gear where the engine runs slower).

If you no longer have the overheat warning, you can drive. Just to be safe, drive slower for about ten minutes. If the warning doesn’t come back on, you can drive normally.

If the warning continues, pull over, stop, and park your vehicle right away.

If there’s still no sign of steam, you can idle the engine for two or three minutes while you’re parked, to see if the warning stops.

But then, if you still have the warning, TURN OFF THE ENGINE AND GET EVERYONE OUT OF THE VEHICLE until it cools down.

You may decide not to lift the hood but to get service help right away.

**CAUTION**

An electric fan under the hood can start up even when the engine is not running and can injure you. Keep hands, clothing, and tools away from any underhood electric fan.
Cooling System
When you decide it's safe to lift the hood, here's what you'll see:
(A) Coolant recovery tank
(B) Radiator pressure cap
(C) Electric engine fan
If the coolant inside the coolant recovery tank is boiling, don't do anything else until it cools down.

The coolant level should be at or above the COLD mark.
If it isn't, you may have a leak in the radiator hoses, heater hoses, radiator, water pump or somewhere else in the cooling system.

CAUTION
Heater and radiator hoses, and other engine parts, can be very hot. Don't touch them. If you do, you can be burned.
Don't run the engine if there is a leak. If you run the engine, it could lose all coolant. That could cause an engine fire, and you could be burned. Get any leak fixed before you drive the vehicle.

NOTICE
Engine damage from running your engine without coolant isn't covered by your warranty.

If there seems to be no leak, check to see if the electric engine fan is running. If the engine is overheating, the fan should be running. If it isn't, your vehicle needs service.

How to Add Coolant to the Coolant Recovery Tank:
If you haven't found a problem yet, but the coolant level isn't at or above COLD, add a 50/50 mixture of clean water (preferably distilled) and a proper antifreeze at the coolant recovery tank. (See the Index under Engine Coolant for more information about the proper coolant mix.)
Problems on the Road

Engine Overheating (CONT.)

CAUTION
Adding only plain water to your cooling system can be dangerous. Plain water, or some other liquid like alcohol, can boil before the proper coolant mix will. Your vehicle's coolant warning system is set for the proper coolant mix. With plain water or the wrong mix, your engine could get too hot but you wouldn't get the overheat warning. Your engine could catch fire and you or others could be burned. Use a 50/50 mix of clean water and a proper antifreeze.

NOTICE
In cold weather, water can freeze and crack the engine, radiator, heater core and other parts. Use the recommended coolant.

CAUTION
You can be burned if you spill coolant on hot engine parts. Coolant contains ethylene glycol and it will burn if the engine parts are hot enough. Don't spill coolant on a hot engine.

When the coolant in the coolant recovery tank is at or above COLD, start your vehicle.

If the overheat warning continues, there's one more thing you can try. You can add the proper coolant mix directly to the radiator, but be sure the cooling system is cool before you do it.

CAUTION
Steam and scalding liquids from a hot cooling system can blow out and burn you badly. They are under pressure, and if you turn the radiator pressure cap—even a little—they can come out at high speed. Never turn the cap when the cooling system, including the radiator pressure cap, is hot. Wait for the cooling system and radiator pressure cap to cool if you ever have to turn the pressure cap.
How to Add Coolant to the Radiator:

**NOTICE**

Your engine has a specific radiator fill procedure. Failure to follow the procedure could cause your engine to overheat and be severely damaged.

1. You can remove the radiator pressure cap when the cooling system, including the radiator pressure cap and upper radiator hose, is no longer hot. Turn the pressure cap slowly to the left until it first stops. (Don’t press down while turning the pressure cap.)

   If you hear a hiss, wait for that to stop. A hiss means there is still some pressure left.

2. Then keep turning the pressure cap, but now push down as you turn it. Remove the pressure cap.

**CAUTION**

You can be burned if you spill coolant on hot engine parts. Coolant contains ethylene glycol and it will burn if the engine parts are hot enough. Don’t spill coolant on a hot engine.
Problems on the Road

Engine Overheating (CONT.)

3. After the engine cools, open the coolant air bleed valve or valves.

3.1L V6 (VIN Code T or M): There are two bleed valves. They are located on the thermostat housing and the thermostat bypass tube.

3.4L V6 (VIN Code X): There are two bleed valves. They are located on the thermostat housing and the heater inlet pipe.

4. Fill the radiator with the proper mix, up to the base of the filler neck.

If you see a stream of coolant coming from an air bleed valve, close the valve. Otherwise, close the valve(s) after the radiator is filled.

5. Rinse or wipe any spilled coolant from the engine and compartment.
6. Then fill the coolant recovery tank to the COLD mark.

7. Put the cap back on the coolant recovery tank, but leave the radiator pressure cap off.

8. Start the engine and let it run until you can feel the upper radiator hose getting hot. Watch out for the engine fans.

9. By this time, the coolant level inside the radiator filler neck may be lower. If the level is lower, add more of the proper mix through the filler neck until the level reaches the base of the filler neck.
Problems on the Road

Engine Overheating (cont.)
10. Then replace the pressure cap. Be sure the arrows on the pressure cap line up like this.
11. Check the coolant recovery tank. The coolant level should be at HOT when the engine is hot and at COLD when the engine is cold.

If a Tire Goes Flat

It’s unusual for a tire to “blow out” while you’re driving, especially if you maintain your tires properly. If air goes out of a tire, it’s much more likely to leak out slowly. But if you should ever have a “blowout,” here are a few tips about what to expect and what to do.

If a front tire fails, the flat tire will create a drag that pulls the vehicle toward that side. Take your foot off the accelerator pedal and grip the steering wheel firmly. Steer to maintain lane position, then gently brake to a stop well out of the traffic lane.

A rear blowout, particularly on a curve, acts much like a skid and may require the same correction you’d use in a skid. In any rear blowout, remove your foot from the accelerator pedal. Get the vehicle under control by steering the way you want the vehicle to go. It may be very bumpy and noisy, but you can still steer. Gently brake to a stop, well off the road if possible.

If your tire goes flat, the next section shows how to use your jacking equipment to change a flat tire safely.
Changing a Flat Tire
If a tire goes flat, avoid further tire and wheel damage by driving slowly to a level place. Turn on your hazard warning flashers.

CAUTION

⚠ Changing a tire can cause an injury. The vehicle can slip off the jack and roll over you or other people. You and they could be badly injured. Find a level place to change your tire. To help prevent the vehicle from moving:
1. Set the parking brake firmly.
2. Put the shift lever in P (Park).
3. Turn off the engine.
To be even more certain the vehicle won't move, you can put chocks at the front and rear of the tire farthest away from the one being changed. That would be the tire on the other side of the vehicle, at the opposite end.

The following steps will tell you how to use the jack and change a tire.
The equipment you'll need is in the trunk.
1. Pull the carpeting from the floor of the trunk.
2. Turn the center retainer bolt on the compact spare tire housing counterclockwise to remove it, then lift the tire cover.
Problems on the Road

Changing a Flat Tire (CONT.)

3. Turn the wheel wrench retainer nut located under the tire cover counterclockwise to remove the wheel wrench.

4. Remove the wing nut securing the compact spare tire and spacer by turning it counterclockwise. Then lift off the spacer and remove the spare tire.

5. Remove the bolt securing the jack by turning it counterclockwise. Then remove the jack.
6. If there is a wheel cover remove it by using the wedge end of the socket wrench to pry gently in a notch at the edge of the center cap. Do not use a tool that is narrower, such as a screwdriver, to pry in this notch. You may damage the wheel cover or the center cap.

You may also have plastic nut caps. Loosen the plastic nut caps with the wheel wrench. They won't come off. Then pry along the edge of the wheel cover until it comes off.

7. If your vehicle has exposed wheel nut caps, remove them using the wheel nut wrench.

8. Using the wheel wrench, loosen all the wheel nuts. Don't remove them yet.
Problems on the Road

Changing a Flat Tire (CONT.)

9. Attach the socket end of the wheel wrench to the jack. Turn the wheel wrench clockwise to raise the jack head a few inches.

10. Position the jack and raise the jack head until it fits firmly into the notch in the vehicle’s frame nearest the flat tire. Do not raise the vehicle yet. Put the compact spare tire near you.

CAUTION

Getting under a vehicle when it is jacked up is dangerous. If the vehicle slips off the jack, you could be badly injured or killed. Never get under a vehicle when it is supported only by a jack.

NOTICE

Raising your vehicle with the jack improperly positioned will damage the vehicle or may allow the vehicle to fall off the jack. Be sure to fit the jack lift head into the proper location before raising your vehicle.
11. Raise the vehicle by rotating the wheel wrench clockwise. Raise the vehicle far enough so there's enough room for the spare tire to fit.

12. Remove all the wheel nuts and take off the flat tire.

**CAUTION**

Rust or dirt on the wheel, or on the parts to which it is fastened, can make the wheel nuts become loose over a time. The wheel could come off and cause an accident. When you change a wheel, remove any rust or dirt from the places where the wheel attaches to the vehicle. In an emergency, you can use a cloth or a paper towel to do this, but be sure to use a scraper or wire brush later, if you need to, to get all the rust or dirt off.

13. Remove any rust or dirt from the wheel bolts, mounting surfaces or spare wheel. Place the spare on the wheel mounting surface.

**CAUTION**

Never use oil or grease on studs or nuts. If you do, the nuts might come loose. Your wheel could fall off, causing a serious accident.
Problems on the Road

Changing a Flat Tire (CONT.)

14. Replace the wheel nuts with the rounded end of the nuts toward the wheel. Tighten each nut by hand until the wheel is held against the hub.

15. Lower the vehicle by rotating the wheel wrench counterclockwise. Lower the jack completely.

16. Tighten the wheel nuts firmly in a criss-cross sequence as shown. Don't try to put a wheel cover on your compact spare tire. It won't fit. Store the wheel cover in the trunk until you have the flat tire repaired or replaced.

NOTICE

Wheel covers won’t fit on your compact space. If you try to put a wheel cover on your compact spare, you could damage the cover or the spare.
17. Store the flat tire as far forward in the trunk as possible. Store the jack and wheel wrench in their compartment in the trunk.

**Compact Spare Tire**

Although the compact spare was fully inflated when your vehicle was new, it can lose air after a time. Check the inflation pressure regularly. It should be 60 psi (420 kPa). The compact spare is made to go up to 3,000 miles (5,000 km), so you can finish your trip and have your full-size tire repaired or replaced where you want. Of course, it’s best to replace your spare with a full-size tire as soon as you can. Your spare will last longer and be in good shape in case you need it again. Your anti-lock brake system warning light may come on when you are driving with a compact spare. See the indicator under Anti-Lock Brake System Warning Light.
Problems on the Road

Compact Spare Tire (CONT.)

NOTICE

Don't take your compact spare through an automatic car wash with guide rails. The compact spare can get caught on the rails. That can damage the tire and wheel, and maybe other parts of your vehicle.

DON'T USE YOUR COMPACT SPARE ON SOME OTHER VEHICLE.

And don't mix your compact spare or wheel with other wheels or tires. They won't fit. Keep your spare and its wheel together.

NOTICE

Tire chains won't fit your compact spare. Using them will damage your vehicle and destroy the chains too. Don't use tire chains on your compact spare.

If You're Stuck: In Sand, Mud, Ice or Snow

What you don't want to do when your vehicle is stuck is to spin your wheels. The method known as “rocking” can help you get out when you're stuck, but you must use caution.
If you let your tires spin at high speed, they can explode and you or others could be injured. And, the transaxle or other parts of the vehicle can overheat. That could cause an engine compartment fire or other damage. When you're stuck, spin the wheels as little as possible. Don't spin the wheels above 35 mph (56 km/h) as shown on the speedometer.

Spinning your wheels can destroy parts of your vehicle as well as the tires. If you spin the wheels too fast while shifting your transaxle back and forth, you can destroy your transaxle.

Rocking Your Vehicle to Get it Out:
First, turn your steering wheel left and right. That will clear the area around your front wheels. Then shift back and forth between R (Reverse) and a forward gear, spinning the wheels as little as possible. Release the accelerator pedal while you shift, and press lightly on the accelerator pedal when the transaxle is in gear. If that doesn't get you out after a few tries, you may need to be towed out. If you do need to be towed out, see the Index under Towing Your Oldsmobile.
Part 6
Service & Appearance Care

Here you will find information about the care of your Oldsmobile. This part begins with service and fuel information, and then it shows how to check important fluid and lubricant levels. There is also technical information about your vehicle, and a section devoted to its appearance care.

**Service & Appearance Care**

**Service**
Your Oldsmobile dealer knows your vehicle best and wants you to be happy with it. We hope you'll go to your dealer for all your service needs. You'll get genuine GM parts and GM-trained and supported service people.

We hope you'll want to keep your GM vehicle all GM. Genuine GM parts have one of these marks.

**Doing Your Own Service Work**
If you want to do some of your own service work, you'll want to get the proper Oldsmobile Service Manual. It tells you much more about how to service your Oldsmobile than this manual can. To order the proper service manual, see the Index under Service Publications.

You should keep a record with all parts receipts and list the mileage and the date of any service work you perform. See the Index under Maintenance Record.

---

**CAUTION**
You can be injured if you try to do service work on a vehicle without knowing enough about it.

- Be sure you have sufficient knowledge, experience, and the proper replacement parts and tools before you attempt any vehicle maintenance task.

- Be sure to use the proper tools, and other fasteners. "English" and "metric" fasteners can be easily confused. If you use the wrong fasteners, parts can later break or fall off. You could be hurt.

---

**NOTICE**
If you try to do your own service work without knowing enough about it, your vehicle could be damaged.
Fuel

Use regular unleaded gasoline rated at 87 octane or higher. It should meet specifications ASTM D4814 in the U.S. and CGSB 3.3-92 in Canada. These fuels should have the proper additives, so you should not have to add anything to the fuel.

In the U.S. and Canada, it's easy to be sure you get the right kind of gasoline (unleaded). You'll see "UNLEADED" right on the pump. And only unleaded nozzles will fit into your vehicle's filler neck.

Be sure the posted octane is at least 87. If the octane is less than 87, you may get a heavy, knocking noise when you drive.

If it's bad enough, it can damage your engine.

If you're using fuel rated at 87 octane or higher and you still hear heavy knocking, your engine needs service. But don't worry if you hear a little pinging noise when you're accelerating or driving up a hill. That's normal, and you don't have to buy a higher octane fuel to get rid of pinging. It's the heavy, constant knock that means you have a problem.

Fuel Capacity:
16.5 U.S. Gallons (62 L). Use unleaded fuel only.

What about gasoline with blending materials that contain oxygen, such as MTBE or alcohol?
- MTBE is "methyl tertiary-butyl ether." Fuel that is no more than 15% MTBE is fine for your vehicle.
- Ethanol is ethyl or grain alcohol. Properly-blended fuel that is no more than 10% ethanol is fine for your vehicle.
- Methanol is methyl or wood alcohol.

NOTICE

Fuel that is more than 5% methanol is bad for your vehicle. Don't use it. It can corrode metal parts in your fuel system and also damage plastic and rubber parts. That damage wouldn't be covered under your warranty. And even at 5% or less, there must be "residuals" and corrosion preventers in this fuel to help avoid these problems.
Gasolines for Cleaner Air
Your use of gasoline with detergent additives will help prevent deposits from forming in your engine and fuel system. That helps keep your engine in tune and your emission control system working properly. It's good for your vehicle, and you'll be doing your part for cleaner air.

Many gasolines are now blended with materials called oxygenates. General Motors recommends that you use gasolines with these blending materials, such as MTBE and ethanol. By doing so, you can help clean the air, especially in those parts of the country that have high carbon monoxide levels.

In addition, some gasoline suppliers are now producing reformulated gasolines. These gasolines are specially designed to reduce vehicle emissions. General Motors recommends that you use reformulated gasoline. By doing so, you can help clean the air, especially in those parts of the country that have high ozone levels.

You should ask your service station operators if their gasolines contain detergents and oxygenates, and if they have been reformulated to reduce vehicle emissions.

Fuels In Foreign Countries
If you plan on driving in another country outside the U.S. or Canada, unleaded fuel may be hard to find. Do not use leaded gasoline. If you use even one tankful, your emission controls won't work well or at all. With continuous use, spark plugs can get fouled, the exhaust system can corrode, and your engine oil can deteriorate quickly. Your vehicle's oxygen sensor will be damaged. All of that means costly repairs that wouldn't be covered by your warranty.
Filling Your Tank

The cap is behind a hinged door on the left side of your vehicle.

**CAUTION**

Gasoline vapor is highly flammable. It burns violently, and that can cause very bad injuries. Don’t smoke if you’re near gasoline or refueling your vehicle. Keep sparks, flames, and smoking materials away from gasoline.

To take off the cap, turn it slowly to the left (counterclockwise).

While refueling, hang the cap inside the fuel door.

**CAUTION**

If you get gasoline on you and then something ignites it, you could be badly burned. Gasoline can spray out of you if you open the fuel filler cap too quickly. This spray can happen if your tank is nearly full, and is more likely in hot weather. Open the fuel filler cap slowly and wait for any "hiss" noise to stop. Then unscrew the cap all the way.

When you put the cap back on, turn it to the right until you hear a clicking noise.
Checking Things Under the Hood

The following sections tell you how to check fluids, lubricants and important parts under hood.

Hood Release
To open the hood, first pull the handle inside the vehicle.
Then go to the front of the vehicle and release the secondary hood release.
Lift the hood.

**CAUTION**

An electric fan under the hood can start up and injure you even when the engine is not running. Keep hands, clothing and tools away from any underhood electric fan.

**CAUTION**

Things that burn can get on hot engine parts and start a fire. These include liquids like gasoline, oil, coolant, brake fluid, windshield washer and other fluids, and plastic or rubber. You or others could be burned. Be careful not to drop or spill things that will burn onto a hot engine.

Before closing the hood, be sure all the filler caps are on properly. Then just pull the hood down and close it firmly.
Service & Appearance Care

3.1L V6 Engine (CODE T)
When you open the hood, you’ll see:
1. Power Steering Fluid Reservoir
2. Automatic Transaxle Fluid Dipstick
3. Brake Fluid Reservoir
4. Windshield Washer Fluid Reservoir
5. Battery
6. Air Cleaner
7. Engine Oil Fill Cap
8. Engine Oil Dipstick
9. Radiator Pressure Cap
10. Engine Coolant Reservoir
When you open the hood, you'll see:

1. Power Steering Fluid Reservoir
2. Automatic Transaxle Fluid Dipstick
3. Brake Fluid Reservoir
4. Windshield Washer Fluid Reservoir
5. Battery
6. Air Cleaner
7. Engine Oil Fill Cap
8. Engine Oil Dipstick
9. Radiator Pressure Cap
10. Engine Coolant Reservoir
Retractable Underhood Light
(OPTION)
To Use:
Pull the light away from the base and attach it to the area of the vehicle where you may be working. A magnet on the back will hold it in place.
To Retract:
1. Turn the crank clockwise.
2. Slide the light back into its base.

Engine Oil
It’s a good idea to check your engine oil level every time you get fuel. In order to get an accurate reading, the oil must be warm and the vehicle must be at level ground.
Turn off the engine and give the oil a few minutes to drain back into the oil pan. If you don’t, the oil dipstick might not show the actual level.
To Check Engine Oil:
Pull out the dipstick and clean it with a paper towel or cloth, then push it back in all the way. Remove it again, keeping the tip lower.

3.1L V6: Checking Engine Oil
3.4L V6: Checking Engine Oil
When to Add Oil:
If the oil is at or below the ADD line, then you’ll need to add some oil. But you must use the right kind. This section explains what kind of oil to use. For crankcase capacity, see the Index under Capacities and Specifications.

**NOTICE**

Don’t add too much oil. If your engine has so much oil that the oil level gets above the cross-hatched area that shows the proper operating range, your engine could be damaged.

Just fill it enough to put the level somewhere in the proper operating range. Push the dipstick all the way back in when you’re through.

What Kind of Oil to Use
Look for Three Things:
- **SG**

“SG” must be on the oil container, either by itself or combined with other quality designations, such as “SG/CC,” “SG/CD,” “SF, SG, CC,” etc. These letters show American Petroleum Institute (API) levels of quality.

**NOTICE**

If you use oils that don’t have the SG designation, you can cause engine damage not covered by your warranty.
What Kind of Oil to Use (CONT.)

- SAE 5W-30
  As shown in the viscosity chart, SAE 5W-30 is best for your vehicle. However, you can use SAE 10W-30 if it's going to be 0°F (-18°C) or above. These numbers on an oil container show its viscosity, or thickness. Do not use other viscosity oils such as SAE 10W-40 or SAE 20W-50.

- Energy Conserving II
  Oils with these words on the container will help you save fuel. This doughnut-shaped logo (symbol) is used on most oil containers to help you select the correct oil. You should look for this on the oil container, and use only those oils that display the logo.
  GM Goodwrench® Oil (in Canada, GM Engine Oil) meets all the requirements for your vehicle.

- Engine Oil Additives
  Don't add anything to your oil. Your Oldsmobile dealer is ready to advise if you think something should be added.
When to Change Engine Oil
See if any one of these is true for you:
• Most trips are less than 4 miles (6 km).
• It’s below freezing outside and most trips are less than 10 miles (16 km).
• The engine is at low speed most of the time (as in door-to-door delivery, or in stop-and-go traffic).
• You tow a trailer often.
• Most trips are through dusty places.
If any one of these is true for your vehicle, then you need to change your oil and oil filter every 4,000 miles (6,000 km) or 3 months—whichever comes first.
If none of them is true, change the oil every 7,500 miles (12,000 km) or 12 months—whichever comes first.
Change the filter at the first oil change and at every other oil change after that.

Engine Block Heater
An engine block heater can be a big help if you have to park outside in very cold weather, 0°F (-18°C) or colder. If your vehicle has this option, see the Index under Engine Block Heater.

What to Do with Used Oil
CAUTION
Used engine oil contains things that have caused skin cancer in laboratory animals. Don’t let used oil stay on your skin for very long. Clean your skin and nails with soap and water, or a good hand cleaner. Wash or properly throw away clothing or rags containing used engine oil.

Used oil can be a real threat to the environment. If you change your own oil, be sure to drain all free-flowing oil from the filter before disposal. Don’t ever dispose of oil by pouring it on the ground, into sewers, or into streams or bodies of water. Instead, recycle it by taking it to a place that collects used oil. If you have a problem properly disposing of your used oil, ask your dealer, a service station or a local recycling center for help.
Air Cleaner
Refer to the Maintenance Schedule to determine when to replace the air filter and the PCV filter.
See the index under Scheduled Maintenance Services.

CAUTION
Operating the engine with the air cleaner off can cause you or others to be burned. The air cleaner not only cleans the air, it stops flame if the engine backfires. If it isn't there, and the engine backfires, you could be burned. Don't drive with it off, and be careful working on the engine with the air cleaner off.

NOTICE
If the air cleaner is off, a backfire can cause a damaging engine fire. And, dirt can easily get into your engine, which will damage it. Always leave the air cleaner in place when you're driving.

To Check or Replace:
1. Remove the four screws and pull off the cover.
2. Remove the air cleaner filter.
3. Be sure to install the air cleaner filter and replace the cover tightly.

**Automatic Transaxle Fluid**

**When to Check and Change:**
A good time to check your automatic transaxle fluid level is when your engine oil is changed. Refer to your Maintenance Schedule to determine when to change your fluid. See the Index under Scheduled Maintenance Services.

**How to Check:**
Because this operation can be a little difficult, you may choose to have this done at an Oldsmobile dealership Service Department.

If you do it yourself, be sure to follow all the instructions here, or you could get a false reading on the dipstick.

**NOTICE**
Too much or too little fluid can damage your transaxle. Too much can mean that some of the fluid could come out and fall on hot engine parts, starting a fire. Be sure to get an accurate reading if you check your transaxle fluid.
Automatic Transaxle Fluid (cont.)

Wait at least 30 minutes before checking the transaxle fluid level if you have been driving:
- When outside temperatures are above 90°F (32°C).
- At high speed for quite awhile.
- In heavy traffic—especially in hot weather.
- While pulling a trailer.

To get the right reading, the fluid should be at normal operating temperature, which is 180°F to 200°F (82°C to 93°C).

Get the vehicle warmed up by driving about 15 miles (24 km) when outside temperatures are above 50°F (10°C). If it's colder than 50°F (10°C), you may have to drive longer.

To Check the Fluid Level:
- Park your vehicle on a level place.
- Place the shift lever in P (Park) with the parking brake applied.
- With your foot on the brake pedal, move the shift lever through each gear range, pausing for about three seconds in each range. Then, position the shift lever in P (Park).
- Let the engine run at idle for three to five minutes.

Then, Without Shutting off the Engine, Follow These Steps:
1. Pull out the dipstick and wipe it with a clean rag or paper towel.
2. Push it back in all the way, wait three seconds and then pull it back out again.
3. Check both sides of the dipstick, and read the lower level. The fluid level must be in the crosshatched area.
4. If the fluid level is where it should be, push the dipstick back in all the way.
How to Add Transaxle Fluid:

Refer to the Maintenance Schedule to determine what kind of transaxle fluid to use. See the Index under Fluids and Lubricants.

If the fluid level is low, add only enough of the proper fluid to bring the fluid level into the cross-hatched area on the dipstick. It doesn't take much fluid, generally less than a pint (0.5L). Don't overfill. We recommend you use only fluid labeled DEXRON®-III, because fluids with that label are made especially for your automatic transaxle. Damage caused by fluid other than DEXRON®-III is not covered by your new vehicle warranty.

After adding fluid, recheck the fluid level as described under How to Check. When the correct fluid level is obtained, push the dipstick back in all the way.
Service & Appearance Care

Engine Coolant

The following explains your cooling system and how to add coolant when it is low. If you have a problem with engine overheating or if you need to add coolant to your radiator, see the Index under Engine Overheating.

The proper coolant for your Oldsmobile will:

- Give freezing protection down to -34°F (-37°C).
- Give boiling protection up to 262°F (128°C).
- Protect against rust and corrosion.
- Help keep the proper engine temperature.
- Let the warning lights work as they should.

What to Use:

Use a mixture of one-half clean water (preferably distilled) and one-half antifreeze that meets “GM Specification 1823M,” which won’t damage aluminum parts. You can also use a recycled coolant conforming to GM Specification 1825M with a complete coolant flush and refill. Use GM Engine Coolant Supplement (sealer) with any complete coolant change. If you use these, you don’t need to add anything else.

NOTICE

If you use an improper coolant mix, your engine could overheat and be badly damaged. The repair cost wouldn’t be covered by your warranty. Too much water in the mix can freeze and crack the engine, radiator, heater core and other parts.

CAUTION

Adding only plain water to your cooling system can be dangerous. Plain water, or some other liquid like alcohol, can boil before the proper coolant mix will. Your vehicle’s coolant warning system is set for the proper coolant mix. With plain water or the wrong mix, your engine could get too hot but you wouldn’t get the overheat warning. Your engine could catch fire and you or others could be burned. Use a 50/50 mix of clean water and a proper antifreeze.
Adding Coolant

To Check Coolant:
When your engine is cold, the coolant level should be between the COLD and HOT marks or a little higher. When your engine is warm, the level should be up to HOT, or a little higher.

If this light comes on, it means you’re low on engine coolant.

To Add Coolant:
If you need more coolant, add the proper mix at the coolant recovery tank.

CAUTION
Turning the radiator pressure cap when the engine and radiator are hot can allow steam and scalding liquids to blow out and burn you badly. With the coolant recovery tank, you will almost never have to add coolant at the radiator. Never turn the radiator pressure cap—even a little—when the engine and radiator are hot.
Adding Coolant (CONT.)
Add coolant mix at the recovery tank, but be careful not to spill it.

CAUTION
You can be burned if you spill coolant on hot engine parts. Coolant contains ethylene glycol, and it will burn if the engine parts are hot enough. Don’t spill coolant on a hot engine.

Radiator Pressure Cap

NOTICE
Your radiator cap is a 13 psi (0.95 bar) pressure-type cap and must be tightly installed to prevent coolant loss and possible engine damage from overheating. Be sure the arrows on the cap line up with the overflow tube on the radiator filler neck.

When you replace your radiator pressure cap, an AC cap is recommended.

Thermostat
Engine coolant temperature is controlled by a thermostat in the engine coolant system. The thermostat stops the flow of coolant through the radiator until the coolant reaches a preset temperature.

When you replace your thermostat, an AC cap is recommended.
Power Steering Fluid

How to Check Power Steering Fluid:
Unscrew the cap and wipe the dipstick with a clean rag. Replace the cap and completely tighten it. Then remove the cap again and look at the fluid level on the dipstick.
- When the engine compartment is hot, the level should be at the H mark.
- When the engine compartment is cool, the level should be at the C mark.

What to Add:
Refer to the Maintenance Schedule to determine what kind of fluid to use. See the Index under Fluids & Lubricants.

NOTICE
When adding power steering fluid or making a complete fluid change, always use the proper fluid. Failure to use the proper fluid can cause leaks and damage hoses and seals.

Windshield Washer Fluid

To Add:
Open the cap labeled WASHER FLUID ONLY. Add washer fluid until the bottle is full.
Windshield Washer Fluid (CONT.)

NOTICE
- When using concentrated washer fluid, follow the manufacturer's instructions for adding water.
- Don't mix water with ready-to-use washer fluid. Water can cause the solution to freeze and damage your washer fluid tank and other parts of the washer system. Also water doesn't clean as well as washer fluid.
- Fill your washer fluid tank only to fill when it's very cold. This allows for expansion, which could damage the tank if it is completely full.
- Don't use motor antifreeze in your windshield washer. It can damage your washer system and paint.

Brake Master Cylinder

Your brake master cylinder is here. It is filled with DOT-3 brake fluid. Your vehicle is equipped with either Standard Power Brakes or the Anti-Lock Brake System.

There are only two reasons why the brake fluid level in your master cylinder might go down. The first is that the brake fluid goes down to an acceptable level during normal brake lining wear. When new linings are put in, the fluid level goes back up.

The other reason is that fluid is leaking out of the brake system. If it is, you should have your brake system fixed, since a leak means that sooner or later your brakes won't work well, or won't work at all.

So, it isn't a good idea to "top off" your brake fluid. Adding brake fluid won't correct a leak. If you add fluid when your linings are worn, then you'll have too much fluid when you get new brake linings. You should add (or remove) brake fluid, as necessary, only when work is done on the brake hydraulic system.
If you have too much brake fluid, it can spill on the engine. The fluid will burn if the engine is hot enough. You or others could be burned, and your vehicle could be damaged. Add brake fluid only when work is done on the brake hydraulic system.

When your brake fluid falls to a low level, your brake warning light will come on. See the Index under Brake System Warning Light.

What to Add:
When you do need brake fluid, use only DOT-3 brake fluid—such as Delco Supreme II® (GM Part No. 1052535). Use new brake fluid from a sealed container only.

NOTICE
- DOT-3 silicone brake fluid can damage your vehicle. Don't use it.
- Don't let someone put in the wrong kind of fluid. For example, just a few drops of motor-based oil, such as engine oil, in your brake system can damage brake system parts so badly that they'll have to be replaced.
- Brake fluid can damage paint, so be careful not to spill brake fluid on your vehicle.

Replacing Brake System Parts
The braking system on a modern vehicle is complex. Its many parts have to be of top quality and work well together if the vehicle is to have really good braking. Vehicles we design and test have top-quality GM brake parts in them, as your Oldsmobile does when it is new. When you replace parts of your braking system—for example, when your brake linings wear down and you have to have new ones put in—be sure you get new genuine GM replacement parts. If you don't, your brakes may no longer work properly. For example, if someone puts in brake linings that are wrong for your vehicle, the balance between your front and rear brakes can change, for the worse. The braking performance you've come to expect can change in many other ways if someone puts in the wrong replacement brake parts.
Service & Appearance Care

Battery
Every new Oldsmobile has a Delco Freedom® battery. You never have to add water to one of these. When it's time for a new battery, we recommend a Delco Freedom® battery. Get one that has the catalog number shown on the original battery's label.

Jump Starting
For jump starting instructions, see the Index under Jump Starting.

Vehicle Storage
If you're not going to drive your vehicle for 25 days or more, take off the slack negative (−) cable from the battery. This will help keep your battery from running down.

CAUTION
Batteries have acid that can burn you and gas that can explode. You can be badly hurt if you aren't careful. See the Index under Jump Starting for tips on working around a battery without getting hurt.

Contact your dealer to learn how to prepare your vehicle for longer storage periods.

Bulb Replacement
In this section you'll find directions for changing the light bulbs in some of the lights on your Oldsmobile. You'll also find directions for adjusting the alignment of the mini-quad headlights, if you have this type.

Be sure to read the directions before you begin to replace or adjust any lights. See the Index under Replacement Bulbs to find the type of bulb you need to use.

Halogen Bulbs

CAUTION
Halogen bulbs have pressurized gas inside and can burst if you drop or scratch the bulb. You or others could be injured. Take special care when handling and disposing of halogen bulbs.
Checking Aim of the Headlights (2-Door Models)

Your vehicle has the 55 x 135 mini-quad headlight system. These headlights have horizontal and vertical aim indicators. The aim has been preset at the factory and should need no further adjustment.

To check the aim, the vehicle should be properly prepared as follows:

- The vehicle must have all four tires on a perfectly level surface.
- The vehicle should not have any snow, ice or mud attached to it.
- There should not be any cargo or loading of vehicle, except it should have a full tank of gas and one person or 160 pounds (75 kg) on the driver's seat.
- Tires should be properly inflated.
- The horizontal indicator should read 0 (zero).

NOTICE

To make sure your headlights are aimed properly, read all the instructions before beginning. Failure to follow these instructions could cause damage to headlight parts.
Checking Aim of the Headlights (CONT.)
State inspection stations will allow a vertical reading of up plus .76 degrees or down minus .76 degrees for the center of the bubble. It is recommended that the upper limit not exceed up plus .4 degrees for the center of the bubble. There may be an increased chance of being flashed if adjustment is much above up plus .4 degrees.

Aiming Headlights (2-DOOR MODELS)
To check the aim, the vehicle should be properly prepared as follows:
- The vehicle must have all four tires on a perfectly level surface.
- The vehicle should not have any snow, ice or mud attached to it.
- There should not be any cargo or loading of vehicle, except it should have a full tank of gas and one person or 160 pounds (75 kg) on the driver's seat.
- Tires should be properly inflated.
- The horizontal indicator should read 0 (zero).

1. Start with the horizontal (left and right) headlight aim. Don't try to adjust the vertical (up and down) aim first.
2. Check the horizontal aim for each headlight and adjust it as necessary.
3. Turn the horizontal aiming screw until the pointer is lined up with the 0 (zero).
4. Now adjust the vertical aim. Check the vertical aim for each headlight and adjust it as necessary.

5. Turn the vertical aiming screw until the bubble in the level is centered at 0 (zero).

To Replace a Headlight (2-DOOR MODELS)

Before replacing a headlight that does not light, check to make sure that the wiring connector is securely fastened to it.

See the Index under Replacement Bulbs to check the size and type of headlight you need to use before you begin to replace the headlight. You must replace a headlight with one that is exactly the same.

1. Pry up the plastic pins and remove the headlight cover.
To Replace a Headlight (CONT.)

2. Remove the Torx® head screws at the end of the aiming ring. The aiming ring will swing open like a gate.
3. Remove the aiming ring from the assembly.

4. Remove the wiring connector from the headlight socket by lifting the plastic locking tabs on the connector and pulling it from the socket.

5. Check the new headlight again. The number on the top of the light (A) must match the number on the headlight being replaced. The letter, "U" or "L," must also match.
6. Plug the wiring connector into the headlight socket. Snap the locking tabs onto the socket.

7. Place the new headlight in the headlight assembly. The socket must be pointing in the same direction the socket on the burned-out bulb was.

8. Insert the tabs on the aiming ring into the slots in the headlight assembly.

9. Holding the aiming ring closed, insert the screws at the end of the ring. Tighten the screws until the aiming ring touches the plastic nuts on both the top and bottom. Do not overtighten. Do not damage the vertical aiming bubble.
To Replace a Headlight (CONT.)

To check the aim, the vehicle should be properly prepared as follows:

1. The vehicle must have all four tires on a perfectly level surface.
2. The vehicle should not have any snow, ice or mud attached to it.
3. There should not be any cargo or loading of vehicle, except it should have a full tank of gas and one person or 160 pounds (75 kg) on the driver's seat.
4. Tires should be properly inflated.
5. The horizontal indicator should read 0 (zero).

If your vehicle is damaged in an accident and the headlight aim seems to be affected, see your Oldsmobile dealer. Headlights on damaged vehicles may require recalibration of the horizontal aim by your Oldsmobile dealer.

Headlight Replacement

(4-DOOR MODELS)

See the Index under Replacement Bulbs to check the type of bulbs to use.

To Replace a Bulb:

1. Turn the L-shaped bulb assembly counterclockwise 1/4 turn until the flanges align with the slots in the retainer ring. You may need to twist it back and forth slightly to loosen it.
2. Pull out the bulb assembly.
3. Disconnect the bulb wiring harness from the socket bulb assembly by lifting the plastic locking tab.
4. Snap a new bulb assembly into the wiring harness.
5. Replace the bulb assembly by reversing step one.

**Taillight Bulb Replacement**
*(2-DOOR MODELS)*

For the type of bulb, see the index under Replacement Bulbs.

1. Remove the two large plastic screws and pull the carpet away from the rear corner of the trunk.

2. Press the bulb housing release lever and turn the housing ⅛ turn counterclockwise to remove it.
Service & Appearance Care

Taillight Bulb Replacement (CONT.)
3. To remove the bulb, pull it from the assembly.
4. Reverse all steps to reassemble the taillight housing.

Taillight Bulb Replacement (4-DOOR MODELS)
For the type of bulb, see the index under Replacement Bulbs.
1. Remove the two large plastic screws and pull the carpet away from the rear corner of the trunk.

2. Remove the two wing nuts.
3. Pull the taillight housing away from the body of the vehicle.
4. Press the bulb housing release lever and turn the housing to turn counterclockwise to remove it.

5. To replace the bulb, pull it from the assembly.

6. Reverse all steps to reassemble the taillight.

Oldsmobile recommends that you not change your fog light bulb unless you have the proper aiming equipment. See your Oldsmobile dealer for help with this.
Windshield Wiper Blade Replacement
Replacement blades come in different types and are removed in different ways. Here's how to remove the type with a release clip:
1. Pull the windshield wiper arm away from the windshield.
2. Lift the release clip with a screwdriver and pull the blade assembly off the wiper arm.
3. Push the new wiper blade securely on the wiper arm.

Loading Your Vehicle
Two labels on your vehicle show how much weight it may properly carry. The Tire-Loading Information label found on the inside of the trunk lid tells you the proper size, speed rating and recommended inflation pressures for the tires on your vehicle. It also gives you important information about the number of people that can be in your vehicle and the total weight that you can carry. This weight is called the Vehicle Capacity Weight and includes the weight of all occupants, cargo, and all nonfactory-installed options.

The other label is the Certification label, on the rear edge of the driver's door. It tells you the gross weight capacity of your vehicle, called the GVWR (Gross Vehicle Weight Rating). The GVWR includes the weight of the vehicle, all occupants, fuel and cargo. Never exceed the GVWR for your vehicle, or the Gross Axle Weight Rating (GAWR) for either the front or rear axle.

And, if you do have a heavy load, you should spread it out. Don't carry more than 167 lbs. (75 kg) in your trunk.
CAUTION

Do not load your vehicle any heavier than the GVWR or the maximum front and rear GAWR. If you do, parts on your vehicle can break, or it can change the way your vehicle handles. These could cause you to lose control. Also, overloading can shorten the life of your vehicle.

NOTICE

Your warranty does not cover parts or components that fail because of overloading.

If you put things inside your vehicle—like suitcases, tools, packages, or anything else—they will go as fast as the vehicle goes. If you have to stop or turn quickly, or if there is a crash, they’ll keep going.

CAUTION

Things you put inside your vehicle can strike and injure people in a sudden stop or turn, or in a crash.

• Put things in the trunk of your vehicle. In a trunk, put them as far forward as you can. Try to spread the weight evenly.
• Never stack heavier things, like suitcases, inside the vehicle so that some of them are above the tops of the seats.
• When you carry something inside the vehicle, secure it whenever you can.
• Don’t leave a seat folded down unless you need to.
Tires

We don't make tires. Your new vehicle comes with high quality tires made by a leading tire manufacturer. These tires are warranted by the tire manufacturer and their warranties are delivered with every new Oldsmobile. If your spare tire is a different brand than your road tires, you will have a tire warranty folder from each of these manufacturers.

CAUTION

Poorly maintained and improperly used tires are dangerous.

- Overloading your tires can cause overheating as a result of too much friction. You could have an air-out and a serious accident. See Loading Your Vehicle earlier in this section.

- Underinflated tires pose the same danger as overloaded tires. The resulting accident could cause serious injury. Check all tires frequently to maintain the recommended pressure. Tire pressure should be checked when your tires are cold.

- Overinflated tires are more likely to be cut, punctured, or broken by a sudden impact, such as when you hit a pothole. Keep tires at the recommended pressure.

- Worn, old tires can cause accidents. If your tread is badly worn, or if your tires have been damaged, replace them.
Inflation—Tire Pressure

The Tire-Loading Information label, which is on the inside of the trunk lid, shows the correct inflation pressures for your tires, when they're cold. "Cold" means your vehicle has been sitting for at least three hours or driven no more than a mile.

NOTICE

Don't let anyone tell you that underinflation or overinflation is all right. It's not. If your tires don't have enough air (underinflation), you can get:

- Too much flexing
- Too much heat
- Tire overloading
- Bad wear
- Bad handling
- Bad fuel economy.

If your tires have too much air (overinflation), you can get:

- Unusual wear
- Bad handling
- Rough ride
- Needless damage from road hazards.

When to Check:

Check your tires once a month or more. Don't forget your compact spare tire. It should be at 60 psi (420 kPa).

How to Check:

Use a good quality pocket-type gage to check tire pressure. Simply looking at the tires will not tell you the pressure, especially if you have radial tires—which may look properly inflated even if they're underinflated.

If your tires have valve caps, be sure to put them back on. They help prevent leaks by keeping out dirt and moisture.
**Tire Inspection and Rotation**

To make your tires last longer, have them inspected and rotated at the mileages recommended in the Maintenance Schedule. See the Index under Scheduled Maintenance Services. Use this rotation pattern.

After the tires have been rotated, adjust the front and rear inflation pressure as shown on the Tire Loading Information label. Make certain that all wheel nuts are properly tightened. See the Index under Wheel Nut Torque.

---

**CAUTION**

Rust or dirt on a wheel, or on the parts to which it is fastened, can make the wheel nuts become loose after a time. The wheel could come off and cause an accident. When you change a wheel, remove any rust or dirt from places where the wheel attaches to the vehicle. In an emergency, you can use a cloth or a paper towel to do this, but be sure to use a scrapper or wire brush later, if you need to, to get all the rust or dirt off. (See the Index under Changing a Flat Tire.)
When It's Time for New Tires

One way to tell when it's time for new tires is to check the treadwear indicators, which will appear when your tires have only 2/32 inch (1.6 mm) or less of tread remaining.

You need a new tire if:
- You can see the indicators at three places around the tire.
- You can see cord or fabric slacking through the tire's rubber.
- The tread or sidewall is scratched, cut or shredded deep enough to show cord or fabric.
- The tire has a bump, bulge or split.
- The tire has a puncture, cut or other damage that can't be repaired well because of the size or location of the damage.

Buying New Tires

To find out what kind and size of tires you need, look at the Tire-Loading Information label. The tires installed on your vehicle when it was new had a Tire Performance Criteria Specification (TPC Spec) number on each tire's sidewall. When you get new tires, get ones with that same TPC Spec number. That way, your vehicle will continue to have tires that are designed to give proper endurance, handling, speed rating, traction, ride and other things during normal service on your vehicle.

If your tires have an all-season tread design, the TPC number will be followed by a "MS" (for mud and snow).

If you ever replace your tires with those not having a TPC Spec number, make sure they are the same size, load range, speed rating and construction type (bias, bias-belted or radial) as your original tires.

CAUTION

Mixing tires could cause you to lose control while driving. If you mix tires of different sizes or types (radial and bias-belted tires), the vehicle may not handle properly, and you could have a crash. Be sure to use the same size and type tires on all four wheels. It's all right to drive with your compact spare, though. It was developed for use on your vehicle.
The following information relates to the system developed by the United States National Highway Traffic Safety Administration which grades tires by treadwear, traction, and temperature performance. (This applies only to vehicles sold in the United States.)

Treadwear
The treadwear grade is a comparative rating based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and a half (1½) times as well as the government course as a tire graded 100. The relative performance of tires depends upon the actual conditions of use, however, and may depart significantly from the norm due to variations in driving habits, service practices and differences in road characteristics and climate.

Traction—A, B, C
The traction grades, from highest to lowest are: A, B, and C. They represent the tire's ability to stop on wet pavement as measured under controlled conditions on specified government test surfaces of asphalt and concrete. A tire marked C may have poor traction performance.

Warning: The traction grade assigned to this tire is based on braking (straight-ahead) traction tests and does not include cornering (turning) traction.

Temperature—A, B, C
The temperature grades are A (the highest), B, and C, representing the tire's resistance to the generation of heat and its ability to dissipate heat when tested under controlled conditions on a specified indoor laboratory test wheel. Sustained high temperature can cause the material of the tire to degenerate and reduce tire life, and excessive temperature can lead to sudden tire failure. The grade C corresponds to a level of performance which all passenger car tires must meet under the Federal Motor Vehicle Safety Standard No. 109. Grades B and A represent higher levels of performance on the laboratory test wheel than the minimum required by law.
**Warning:** The temperature grade for this tire is established for a tire that is properly inflated and not overloaded. Excessive speed, underinflation, or excessive loading, either separately or in combination, can cause heat buildup and possible tire failure. Those grades are molded on the sidewalls of passenger car tires. While the tires available as standard or optional equipment on General Motors vehicles may vary with respect to these grades, all such tires meet General Motors performance standards and have been approved for use on General Motors vehicles. All passenger type (P Metric) tires must conform to Federal safety requirements in addition to these grades.

**Wheel Alignment and Tire Balance**

The wheels on your vehicle were aligned and balanced carefully at the factory to give you the longest tire life and best overall performance.

In most cases, you will not need to have your wheels aligned again. However, if you notice unusual tire wear or your vehicle pulling one way or the other, the alignment may need to be reset. If you notice your vehicle vibrating when driving on a smooth road, your wheels may need to be rebalanced.

**Wheel Replacement**

Replace any wheel that is bent, cracked or badly rusted. If wheel nuts keep coming loose, the wheel, wheel bolts, and wheel nuts should be replaced. If the wheel leaks air, replace it (except some aluminum wheels, which can sometimes be repaired). See your Oldsmobile dealer if any of these conditions exist. Your dealer will know the kind of wheel you need.

Each new wheel should have the same load carrying capacity, diameter, width, offset, and be mounted the same way as the one it replaces.

If you need to replace any of your wheels, wheel bolts, or wheel nuts, replace them only with new GM original equipment parts. This way you will be sure to have the right wheel, wheel bolts, and wheel nuts for your Oldsmobile model.
Using the wrong replacement wheels, wheel bolts, or wheel nuts on your vehicle can be dangerous. It could affect the braking and handling of your vehicle, make your tires lose air and make you lose control. You could have a collision in which you or others could be injured. Always use the correct wheel, wheel bolts, and wheel nuts for replacement.

NOTICE

The wrong wheel can also cause problems with bearing life, brake cooling, speedometer/odometer calibration, Jon Car ctm, bumper height, vehicle ground clearance, and the position of the chain clearance to the body and chassis.
Cleaning products can be hazardous. Some are toxic. Others can burst into flame if you strike a match or get them on a hot part of the vehicle. Some are dangerous if you breathe their fumes in a closed space. When you use anything in a container to clean your Oldsmobile, be sure to follow the instructions. And always open your doors or windows when you're cleaning the inside.

Never use these to clean your vehicle:
- Gasoline
- Benzene
- Naphtha
- Carbon Tetrachloride
- Acetone
- Paint Thinner
- Turpentine
- Lacquer Thinner
- Nail Polish Remover
- Naphtha
- Paint Thinner
- Nail Polish Remover

They can all be hazardous—some more than others—and they can all damage your vehicle, too.

NOTICE
Don't use any of these unless the manual says you can. In many cases, they will damage your vehicle:
- Laundry Soap
- Bleach
- Reducing Agents
Cleaning the Inside of Your Oldsmobile

Use a vacuum cleaner often to get rid of dust and loose dirt. Wipe vinyl with a clean, damp cloth.

Your Oldsmobile dealer has two GM cleaners—a solvent-type spot lifter and a foam-type powdered cleaner. They will clean normal spots and stains very well.

Here are some cleaning tips:
- Always read the instructions on the cleaner label.
- Clean up stains as soon as you can—before they set.
- Use a clean cloth or sponge, and change to a clean area often. A soft brush may be used if stains are stubborn.
- Use solvent-type cleaners in a well-ventilated area only. If you use them, don't saturate the stained area.
- If a ring forms after spot cleaning, clean the entire area immediately or it will set.

Using Foam-Type Cleaner on Fabric

- Vacuum and brush the area to remove any loose dirt.
- Always clean a whole trim panel or section. Mask surrounding trim along stitch or welt lines.
- Mix Multi-Purpose Powdered Cleaner following the directions on the container label.
- Use suds only and apply with a clean sponge.

Don't saturate the material.
- Don't rub it roughly.
- As soon as you've cleaned the section, use a sponge to remove the suds.
- Raise the section with a clean, wet sponge.
- Wipe off what's left with a slightly damp paper towel or cloth.
- Thoroughly dry it immediately with an air hose, a hair dryer or a heat lamp.

**NOTICE**

Be careful with a hair dryer or heat lamp. You could scorch the fabric.

- Wipe with a clean cloth.
Using Solvent-Type Cleaner on Fabric

First, see if you have to use solvent-type cleaner at all. Some spots and stains will clean off better with just water and mild soap.

If you need to use it, then:

- Gently scrape excess soil from the trim material with a clean, dull knife or scraper. Use very little cleaner, light pressure and clean cloths (preferably cheesecloth). Cleaning should start at the outside of the stain, “feathering” toward the center. Keep changing to a clean section of the cloth.
- When you clean a stain from fabric, immediately dry the area with an air hose, hair dryer, or heat lamp to help prevent a cleaning ring. (See the previous NOTICE.)

Special Cleaning Problems

Greasy or Oily Stains: Like grease, oil, butter, mayonnaise, shoe polish, coffee with cream, chewing gum, cosmetic creams, vegetable oils, wax, crayon, tar and asphalt.

- Carefully scrape off excess stain.
- Then follow the solvent-type instructions above.
- Shoe polish, wax crayon, tar and asphalt will stain if left on a vehicle seat fabric. They should be removed as soon as possible. Be careful, because the cleaner will dissolve them and may cause them to bleed.

Non-Greasy Stains: Like catsup, coffee (black), egg, fruit, fruit juice, milk, soft drinks, wine, vomit, urine and blood.

- Carefully scrape off excess stain, then sponge the soiled area with cool water.
- If a stain remains, follow the foam-type instructions above.
- If an odor lingers after cleaning vomit or urine, treat the area with a water/baking soda solution: 1 teaspoon (5 ml) of baking soda to 1 cup (250 ml) of lukewarm water.
- Finally, if needed, clean lightly with solvent-type cleaner.

Combination Stains: Like candy, ice cream, mayonnaise, chill sauce and unknown stains.

- Carefully scrape off excess stain, then clean with cool water and allow to dry.
- If a stain remains, clean it with solvent-type cleaner.
Cleaning Vinyl or Leather
Just use warm water and a clean cloth.
• Rub with a clean, damp cloth to remove dirt. You may have to do it more than once.
• Things like tar, asphalt and shoe polish will stain if you don’t get them off quickly. Use a clean cloth and solvent-type vinyl/leather cleaner.

Cleaning the Top of the Instrument Panel
Use only mild soap and water to clean the top surfaces of the instrument panel. Sprays containing silicones or waxes may cause annoying reflections in the windshield and even make it difficult to see through the windshield under certain conditions.

Care of Safety Belts
Keep belts clean and dry.

CAUTION
Do not bleach or dye safety belts. If you do, it may severely weaken them. In a crash they might not be able to provide adequate protection. Clean safety belts only with mild soap and lukewarm water.
Glass
Glass should be cleaned often. GM Glass Cleaner (GM Part No. 1050427) or a liquid household glass cleaner will remove normal tobacco smoke and dust films.

Don’t use abrasive cleaners on glass, because they may cause scratches. Avoid placing decals on the inside rear window, since they may have to be scraped off later.

If abrasive cleaners are used on the inside of the rear window, an electric defogger element may be damaged. Any temporary license should not be attached across the defogger grid.

Inside Center High-Mounted Stoplight (2-DOOR MODELS)
For the type of bulb, see the Index under Replacement Bulbs.
If you would like to clean the inside surface of the rear window or need to replace a bulb, you can remove the stoplight housing by following these steps:
1. Remove the two Phillips-head screws from the cover.
2. Remove the cover.
3. Unclip the bulb carrier.
4. Pull the bulb out to replace. Push in a new bulb.
5. Clip the bulb carrier back into place.
6. To remove the stoplight lens to clean the window, remove the two nuts on either side of the housing.
7. Replace the cover.
Service & Appearance Care

Inside Center High-Mounted Stoplight (4-door Models)
For the type of bulb, see the Index under Replacement Bulbs.
If you would like to clean the inside surface of the rear window or need to replace a bulb, you can remove the stoplight housing by following these steps:
1. Remove the two Phillips-head screws from the cover.
2. Pull down the cover.
3. Unclip the bulb socket from the housing.
4. Pull the bulb out to replace. Push in a new bulb.
5. Press the bulb socket back into the housing.
6. Remove the lens to clean the window by pressing in on the ends of the lens.
7. Replace the cover.

Cleaning the Outside of the Windshield and Wiper Blades
If the windshield is not clear after using the windshield washer, or if the wiper blade chatters when running, wax or other material may be on the blade or windshield.
Clean the outside of the windshield with GM Windshield Cleaner, Bon Ami Powder® (GM Part No. 1050011). The windshield is clean if beads do not form when you rinse it with water.
Clean the blade by wiping vigorously with a cloth soaked in full strength windshield washer solvent. Then rinse the blade with water.
Wiper blades should be checked on a regular basis and replaced when worn.
Cleaning the Outside of Your Oldsmobile

The paint finish on your vehicle provides beauty, depth of color, gloss retention and durability.

Washing Your Vehicle

The best way to preserve your vehicle's finish is to keep it clean by washing it often with lukewarm or cold water. Don't wash your vehicle in the direct rays of the sun. Don't use strong soaps or chemical detergents. Use liquid hand, dish or car washing (non-detergent) soaps. Don't use cleaning agents that contain acid or abrasives. All cleaning agents should be flushed promptly and not allowed to dry on the surface, or they could stain. Dry the finish with a soft, clean chamois or a 100% cotton towel to avoid surface scratches and water spotting. High pressure vehicle washes may cause water to enter your vehicle.

Finish Care

Occasional waxing or mild polishing of your Oldsmobile may be necessary to remove residue from the paint finish. You can get GM approved cleaning products from your dealer. (See the Index under Appearance Care.)

Your Oldsmobile has a “basecoat/clearcoat” paint finish. The clearcoat gives more depth and gloss to the colored basecoat.

Aluminum Wheels (If So Equipped)

Your aluminum wheels have a protective coating similar to the painted surface of your Oldsmobile. Don't use strong soaps, chemicals, chrome polish, or other abrasive cleaners on them because you could damage this coating. After rinsing thoroughly, a wax may be applied.

**NOTICE**

Machine compounding or aggressive polishing on a basecoat/clearcoat paint finish may dull the finish or leave swirl marks.

**NOTICE**

If you have aluminum wheels, don't use an automatic vehicle wash that has hard silicon carbide cleaning brushes. These brushes can take off the protective coating.
## Service & Appearance Care

### White Sidewall Tires
Your Oldsmobile dealer has a GM White Sidewall Tire Cleaner. You can use a stiff brush with it.

### Weatherstrips
These are places where glass or metal meets rubber. Silicone grease there will make them last longer, seal better, and not squeak. Apply silicone grease with a clean cloth at least every six months.

### Sheet Metal Damage
If your vehicle is damaged and requires sheet metal repair or replacement, make sure the body repair shop applies anti-corrosion material to the parts repaired or replaced to restore corrosion protection.
**Foreign Material**
Calcium chloride and other salts, ice melting agents, road oil and ice, tree sap, bird droppings, chemicals from industrial chimneys, and other foreign matter can damage your vehicle's finish if they remain on painted surfaces. Use cleaners that are marked safe for painted surfaces for these stains.

**Finish Damage**
Any stone chips, scratches or deep scratches in the finish should be repaired right away. Bare metal will corrode quickly and may develop into a major repair expense.

Minor chips and scratches can be repaired with touch-up materials available from your dealer or other service outlets. Larger areas of finish damage can be corrected in your dealer's body and paint shop.

**Underbody Maintenance**
Chemicals used for ice and snow removal, and dust control can collect on the underbody. If these are not removed, accelerated corrosion (rust) can occur on the underbody parts such as fuel lines, frame, floor pan, and exhaust system even though they have corrosion protection.

At least every spring, flush these materials from the underbody with plain water. Clean any areas where mud and other debris can collect. Dirt packed in closed areas of the frame should be loosened before being flushed. Your dealer or an underbody vehicle washing system can do this for you.
Service & Appearance Care

Fiberglass Springs

**NOTICE**

Don’t use corrosive or acidic cleaning agents, engine degreasers, aluminum cleaning agents or other harsh solvents to clean fiberglass springs; they’ll damage the springs.

Chemical Paint Spotting

Some weather and atmospheric conditions can create a chemical fallout. Airborne pollutants can fall upon and attack painted surfaces on your vehicle. This damage can take two forms: blotchy, ringlet-shaped discolorations, and small irregular dark spots etched into the paint surface.

Although no defect in the paint job causes this, Oldsmobile will repair, at no charge to the owner, the surfaces of new vehicles damaged by this fallout condition within 12 months or 12,000 miles (20,000 km) of purchase, whichever comes first.

Vehicle Identification Number (VIN)

This is the legal identifier for your Oldsmobile. It appears on a plate in the front corner of the instrument panel, on the driver’s side. You can see it if you look through the windshield from outside your vehicle. The VIN also appears on the Vehicle Certification and Service Parts labels and the certificates of title and registration.
**Engine Identification**
The eighth character in your VIN is the engine code for your GM engine. This code will help you identify your engine, specifications, and replacement parts in this section.

**Service Parts Identification Label**
You'll find this label on your spare tire cover. It's very helpful if you ever need to order parts. On this label is:
- Your VIN.
- Its model designation.
- Paint information.
- A list of all production options and special equipment.
Be sure that this label is not removed from the vehicle.

**Add-On Electrical Equipment**

**NOTICE**
Don’t add anything electrical to your Oldsmobile unless you check with your dealer first. Some electrical equipment can damage your vehicle and the damage wouldn’t be covered by your warranty. Some of it can just keep other things from working as they should.
Fuses & Circuit Breakers

The wiring circuits in your vehicle are protected from short circuits by a combination of fuses, circuit breakers, and fusible thermal links in the wiring itself. This greatly reduces the chance of fires caused by electrical problems.

Some fuses are located in a fuse block in the glove box as shown above. To locate the fuse block, lift out the storage bin inside the glove box. See the diagram later in this section.

Another set of fuses is located in the component center, under the instrument panel.

Additional fuses are located in the underhood electrical centers on the right and left sides of the engine compartment.

Spare fuses and a fuse puller are located in the glove box lid. To remove the cover, press in on both ends of the cover and pull it off.

Place the wide end of the fuse puller over the plastic end of the fuse. Squeeze the ends over the fuse and pull it out.

To identify and check fuses, refer to the charts on the following pages.

Look at the silver-colored band inside the fuse. If the band is broken or melted, replace the fuse. Be sure you replace a bad fuse with a new one of the identical size and rating.

Headlight Wiring
The headlight wiring is protected by a circuit breaker in the component center. An electrical overload will cause the lights to go on and off, or in some cases to remain off. If this happens, have your headlight system checked right away.

Windshield Wipers
The windshield wiper motor is protected by a circuit breaker and a fuse. If the motor overheats due to heavy snow, etc., the wiper will stop until the motor cools. If the overload is caused by some electrical problem, have it fixed.

Power Windows and Other Power Options
Circuit breakers in the fuse panel protect the power windows and other power accessories. When the current load is too heavy, the circuit breaker opens and closes, protecting the circuit until the problem is fixed.
## Service & Appearance Care

### Capacities & Specifications

#### Engine Crankcase

<table>
<thead>
<tr>
<th>Capacity Type</th>
<th>Quantity</th>
<th>Volume (L)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.1L V6</td>
<td>4 quarts</td>
<td>3.8 L</td>
</tr>
<tr>
<td>Twin Dual Cam (DOHC) 3.4L V6</td>
<td>5 quarts</td>
<td>4.8 L</td>
</tr>
</tbody>
</table>

When changing filter, up to 1 quart (1 L) more oil may be needed.

#### Automatic Transaxle

When draining/replacing converter, more fluid may be needed.

<table>
<thead>
<tr>
<th>Capacity Type</th>
<th>Quantity</th>
<th>Volume (L)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pan Removal and Replacement</td>

</tr>
</tbody>
</table>

### Refrigerant, Air Conditioning

- Not all air conditioning refrigerants are the same. If the air conditioning system in your vehicle needs refrigerant, be sure the proper refrigerant is used. If you're not sure, ask your Oldsmobile dealer.

### Fuel Tank

- 16.5 gallons
- 62.0 L

### Power Steering

- Pump Only
- 2 pints
- .925 L

### Wheel Nut Torque

- 100 lb. ft. (~400 N·m)

### Battery Size

<table>
<thead>
<tr>
<th>Engine Type</th>
<th>CCA</th>
</tr>
</thead>
<tbody>
<tr>

</table>
This part covers the maintenance required for your Oldsmobile. Your vehicle needs these services to retain its safety, dependability and emission control performance.

Have you purchased the GM Protection Plan? The Plan supplements your new vehicle warranties. See your Oldsmobile dealer for details.
A Word About Maintenance

We at General Motors want to help you keep your vehicle in good working condition. But we don't know exactly how you'll drive it. You may drive very short distances only a few times a week. Or you may drive long distances all the time in very hot, dusty weather. You may use your vehicle in making deliveries. Or you may drive it to work, to do errands or in many other ways.

Because of all the different ways people use their GM vehicles, maintenance needs vary. You may even need more frequent checks and replacements than you will find in the schedules in this part. So please read this part and note how you drive. If you have any questions on how to keep your vehicle in good condition, see your Oldsmobile dealer, the place many GM owners choose to have their maintenance work done. Your dealer can be relied upon to use proper parts and practices.

Your Vehicle and the Environment

Proper vehicle maintenance not only helps to keep your vehicle in good working condition, but also helps the environment. All recommended maintenance procedures are important. Improper vehicle maintenance or the removal of important components can significantly affect the quality of the air we breathe. Improper fluid levels or even the wrong fluid inflation can increase the level of emissions from your vehicle. To help protect our environment, and to help keep your vehicle in good condition, please maintain your vehicle properly.
How This Part is Organized

The remainder of this part is divided into five sections:

Section A: Scheduled Maintenance Services shows what to have done and how often. Some of these services can be complex, so unless you are technically qualified and have the necessary equipment, you should let your dealer's service department or another qualified service center do these jobs.

CAUTION

Performing maintenance work on a vehicle can be dangerous. In trying to do some jobs, you can be seriously injured. Do your own maintenance work only if you have the required know-how and the proper tools and equipment for the job. If you have any doubt, have a qualified technician do the work.

If you are skilled enough to do some work on your vehicle, you will probably want to get the service information GM publishes. You will find a list of publications and how to get them in this manual. See the Index under Service Publications.

Section B: Owner Checks & Services tells you what should be checked whenever you stop for fuel. It also explains what you can easily do to help keep your vehicle in good condition.

Section C: Periodic Maintenance Inspections explains important inspections that your Oldsmobile dealer's service department or another qualified service center should perform.

Section D: Recommended Fluids & Lubricants lists some products GM recommends to help keep your vehicle properly maintained. These products, or their equivalents, should be used whether you do the work yourself or have it done.

Section E: Maintenance Record provides a place for you to record the maintenance performed on your vehicle. Whenever any maintenance is performed, be sure to write it down in this section. This will help you determine when your next maintenance should be done. In addition, it is a good idea to keep your maintenance receipts. They may be needed to qualify your vehicle for warranty repairs.
Using Your Maintenance Schedules
This section tells you the maintenance services you should have done and when you should schedule them. Your Oldsmobile dealer knows your vehicle best and wants you to be happy with it. If you go to your dealer for your service needs, you'll know that GM-trained and supported service people will perform the work using genuine GM parts.

These schedules are for vehicles that:
• carry passengers and cargo within recommended limits. You will find these limits on your vehicle's Tire-Loading Information label. See the Index under Loading Your Vehicle.
• are driven on reasonable road surfaces within legal driving limits.
• use the recommended unleaded fuel. See the Index under Fuel.

Selecting the Right Schedule
First you'll need to decide which of the two schedules is right for your vehicle. Here's how to decide which schedule to follow:
Schedule I

Is any of these true for your vehicle?
- Most trips are less than 4 miles (6 km).
- Most trips are less than 10 miles (16 km) when outside temperatures are below freezing.
- The engine is at low speed most of the time (as in door-to-door delivery, or in stop-and-go traffic).
- You operate your vehicle in dusty areas.
- You tow a trailer. (With some models, you shouldn't ever tow a trailer. See the Index under Towing a Trailer.)

If any one (or more) of these is true for your driving, follow Schedule I.

Schedule II

Follow Schedule II only if none of the above conditions is true.
**Maintenance Schedule**

**Section A: Scheduled Maintenance Services (Cont.)**

**Schedule I**

Follow Schedule I if your vehicle is MAINLY driven under one or more of the following conditions:

- When most trips are less than 4 miles (6 km).
- When most trips are less than 10 miles (16 km) and outside temperatures remain below freezing.
- When most trips include extended idling and/or frequent low-speed operation, as in stop-and-go traffic.
- When towing a trailer.
- When operating in dusty areas.

Schedule I should also be followed if the vehicle is used for delivery service, police, taxi or other commercial applications.

</table>

- indicates services to be performed.
Maintenance Schedule

Section A: Scheduled Maintenance Services (Cont.)

Explanation of Scheduled Maintenance Services
Below are explanations of the services listed in Schedule I and Schedule II.

The proper fluids and lubricants to use are listed in Section D. Make sure whoever services your vehicle uses these. All parts should be replaced and all necessary repairs done before you or anyone else drives the vehicle.

<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>SERVICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Engine Oil and Filter Change*—Always use SG Energy Conserving II oils for proper viscosity. The “SG” designation may be shown alone or in combination with others, such as “SG/CC,” “SG/CD” or “SP, SG, CC,” etc. To determine the preferred viscosity for your vehicle’s engine (e.g., SAE 5W-30 or SAE 10W-30) see the Index under Engine Oil.</td>
</tr>
<tr>
<td>2</td>
<td>Chassis Lubrication—Lubricate the transaxle shift linkage, parking brake cable guides, underbody contact points and linkage. Lubricate the front and rear suspension and steering linkage.</td>
</tr>
</tbody>
</table>

3 Throttle Body Mounting Bolt Torque (3.1L Code T or M engines only)*—Check the torque of the mounting bolts and/or nuts.

4 Tire and Wheel Rotation and Inspection—For proper wear and maximum tire life, rotate your tires following the instructions in this manual. See the Index under Tires, Inspection & Rotation. Check the tires for uneven wear or damage. If you see irregular or premature wear, check the wheel alignment. Check for damaged wheels also.

NOTE: To determine your engine’s displacement and code, see the Index under Engine Identification.

* An Emission Control Service

The U.S. Environmental Protection Agency has determined that the failure to perform this maintenance item will not void the emission warranty or limit recall liability prior to the completion of vehicle useful life. General Motors, however, urges that all recommended maintenance services be performed at the indicated intervals and the maintenance be recorded in Section E: Maintenance Record.
<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>SERVICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td><strong>Engine Accessory Drive Belt(s) Inspection (California 3.1L Code T engine</strong>)**—Inspect the belt for cracks, fraying, wear, and proper tension. Replace as needed.</td>
</tr>
<tr>
<td>6</td>
<td><strong>Camshaft Timing Belt Inspection (3.4L Code X engine only)</strong>—Inspect for cracks, wear, or oiliness. Check tensioner for proper operation. See the service manual. (To purchase a service manual, see the Index under Publications.) Replace parts as needed.</td>
</tr>
<tr>
<td>7</td>
<td><strong>Cooling System Service</strong>—Drain, flush, and refill the system with new or approved recycled coolant conforming to GM Specification 1825M. Keep coolant at the proper mixture as specified. See the Index under Coolant. This provides proper freeze protection, corrosion inhibitor level, and engine operating temperature. Inspect hoses and replace if they are cracked, swollen, or deteriorated. Tighten screw-type hose clamps. Clean the outside of the radiator and air conditioning condenser. Wash the pressure cap and necks. To help ensure proper operation, we recommend a pressure test of both the cooling system and the pressure cap.</td>
</tr>
</tbody>
</table>
| 8       | **Transaxle Service**—Change both the fluid and filter every 15,000 miles (25,000 km) if the vehicle is mainly driven under one or more of these conditions:  
- In heavy city traffic where the outside temperature regularly reaches 90°F (32°C) or higher.  
- In hilly or mountainous terrain.  
- When doing frequent trailer towing. (With some models, you shouldn't ever tow a trailer. See the Index under Towing a Trailer.)  
- Uses such as found in taxi, police car, or delivery service.  
If you do not use your vehicle under any of these conditions, change both the fluid and filter every 100,000 miles (160,000 km). |
| 9       | **Spark Plug Replacement**—Replace spark plugs with the proper type. See the Index under Replacement Parts. |
| 10      | **Spark Plug Wire Inspection**—Inspect for burns, cracks, or other damage. Check the boot fit at the coils and at the spark plugs. Replace wires as needed. |
### Maintenance Schedule

**Section A: Scheduled Maintenance Services (Cont.)**

<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>SERVICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>Positive Crankcase Ventilation Inspection - Inspect system for proper function. Replace any worn, plugged or collapsed hoses or seals. Replace valve only if necessary.</td>
</tr>
<tr>
<td>12</td>
<td>Exhaust Gas Recirculation (EGR) System Inspection (3.4L Code X engine only)* - Conduct the EGR system service as described in the service manual. To purchase a service manual, see the Index under Service Publications.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>SERVICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>
<td>Air Cleaner Filter Replacement* - Replace every 30,000 miles (50,000 km) or more often under dusty conditions. Ask your dealer for the proper replacement intervals for your driving conditions.</td>
</tr>
<tr>
<td>14</td>
<td>Fuel Tank, Cap and Lines Inspection* - Inspect fuel tank, cap and lines (including fuel rails and injection assembly) for damage or leaks. Inspect fuel cap gasket for an even filler neck imprint or any damage. Replace parts as needed. Periodic replacement of the fuel filter is not required.</td>
</tr>
</tbody>
</table>

---

Note: To determine your engine's displacement and code, see the Index under Engine Identification.

* An Emission Control Service.

- The U.S. Environmental Protection Agency has determined that the failure to perform this maintenance item will not void the emissions warranty or federally mandated liability prior to the completion of vehicle useful life. General Motors, however, urges that all recommended maintenance services be performed at the indicated intervals and the maintenance be recorded in Section E: Maintenance Record.
Section B: Owner Checks & Services

Listed below are owner checks and services which should be made at the intervals specified to help ensure the safety, dependability and emission control performance of your vehicle. Be sure any necessary repairs are completed at once. Whenever any fluids or lubricants are added to your vehicle, make sure they are the proper ones, as shown in Section D.

### At Each Fuel Fill (it is important for you or a service station attendant to perform these underhood checks at each fuel fill.)

<table>
<thead>
<tr>
<th>CHECK OR SERVICE</th>
<th>WHAT TO DO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine Oil Level</td>
<td>Check the engine oil level and add the proper oil if necessary. See the Index under Engine Oil for further details.</td>

<tr>
<td>Engine Coolant Level</td>
<td>Check the engine coolant level in the coolant recovery tank and add the proper coolant mix if necessary. See the Index under Coolant for further details.</td>
</tr>
<tr>
<td>Windshield Washer Fluid Level</td>
<td>Check the windshield washer fluid level in the windshield washer tank and add fluid if necessary. See the Index under Windshield Washer Fluid for further details.</td>
</tr>
</tbody>
</table>

### At Least Once a Month

<table>
<thead>
<tr>
<th>CHECK OR SERVICE</th>
<th>WHAT TO DO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tire Inflation</td>
<td>Check tire inflation. Make sure they are inflated to the pressures specified on the Tire-Loading Information label located on the rear edge of the driver’s door. See the Index under Tires for further details.</td>
</tr>
</tbody>
</table>
### At Least Once a Year

<table>
<thead>
<tr>
<th>CHECK OR SERVICE</th>
<th>WHAT TO DO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Lock Cylinders</td>
<td>Lubricate the key lock cylinders with the lubricant specified in Section D.</td>
</tr>
<tr>
<td>Body Lubrication</td>
<td>Lubricate all body door hinges. Also lubricate all hinges and latches, including those for the hood, rear compartment, glove box door, console door and any folding seat hardware. Section D tells you what to use.</td>
</tr>
<tr>
<td>Starter Switch</td>
<td><strong>CAUTION</strong>&lt;br&gt;When you are doing this check, the vehicle could move suddenly. If it does, you or others could be injured. Follow the steps below. &lt;br&gt;1. Before you start, be sure you have enough room around the vehicle. &lt;br&gt;2. Firmly apply both the parking brake (see the Index under Parking Brake if necessary) and the regular brake. &lt;br&gt;NOTE: Do not use the accelerator pedal, and be ready to turn off the engine immediately if it starts. &lt;br&gt;3. Try to start the engine in each gear. The starter should work only in P (Park) or N (Neutral). If the starter works in any other position, your vehicle needs service.</td>
</tr>
<tr>
<td>CHECK OR SERVICE</td>
<td>WHAT TO DO</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Steering Column Lock</td>
<td>While parked, and with the parking brake set, try to turn the key to Lock in each shift lever position.</td>
</tr>
<tr>
<td></td>
<td>• The key should turn to Lock only when the shift lever is in P (Park).</td>
</tr>
<tr>
<td></td>
<td>• The key should come out only in Lock.</td>
</tr>
<tr>
<td><em>CAUTION</em></td>
<td>When you are doing this check, your vehicle could begin to move. You or others could be injured and property could be damaged. Make sure there is room in front of your vehicle in case it begins to roll. Be ready to apply the regular brake at once should the vehicle begin to move.</td>
</tr>
<tr>
<td>Parking Brake and Automatic Transaxle P (Park) Mechanism Check</td>
<td>Park on a fairly steep hill, with the vehicle facing downhill. Keeping your foot on the regular brake, set the parking brake.</td>
</tr>
<tr>
<td></td>
<td>• To check the parking brake: With the engine running and transaxle in N (Neutral), slowly remove foot pressure from the regular brake pedal. Do this until the vehicle is held by the parking brake only.</td>
</tr>
<tr>
<td></td>
<td>• To check the P (Park) mechanism's holding ability: Shift to P (Park). Then release all brakes.</td>
</tr>
<tr>
<td>Underbody Flushing</td>
<td>At least every spring, use plain water to flush any corrosive materials from the underbody. Take care to clean thoroughly any areas where mud and other debris can collect.</td>
</tr>
</tbody>
</table>
Listed below are inspections and services which should be performed at least twice a year (for instance, each spring and fall). You should let your GM dealer's service department or other qualified service center do these jobs. Make sure any necessary repairs are completed at once.

<table>
<thead>
<tr>
<th>INSPECTION OR SERVICE</th>
<th>WHAT SHOULD BE DONE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steering, Suspension and Front-Wheel-Drive Axle Boot and Seal Inspection</td>
<td>Inspect the front and rear suspension and steering system for damaged, loose or missing parts, signs of wear, or lack of lubrication. Inspect the power steering lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc. Clean and then inspect the drive axle boot seals for damage, tears or leakage. Replace seals if necessary.</td>
</tr>
<tr>
<td>Exhaust System Inspection</td>
<td>Inspect the complete exhaust system. Inspect the body near the exhaust system. Look for broken, damaged, missing or out-of-position parts as well as open seams, holes, loose connections, or other conditions which could cause a heat build-up in the floor pan or could let exhaust fumes into the vehicle. See the Index under Engine Exhaust.</td>
</tr>
<tr>
<td>Throttle Linkage Inspection</td>
<td>Inspect the throttle linkage for interference or binding, and for damaged or missing parts. Replace parts as needed.</td>
</tr>
<tr>
<td>Brake System Inspection</td>
<td>Inspect the complete system. Inspect brake lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc. Inspect disc brake pads for wear and rotors for surface condition. Inspect other brake parts, including calipers, parking brake, etc. Check parking brake adjustment. You may need to have your brakes inspected more often if your driving habits or conditions result in frequent braking. NOTE: A low brake fluid level can indicate worn disc brake pads which may need to be serviced. Also, if the brake system warning light stays on or comes on, something may be wrong with the brake system. See the Index under Brake System Warning Light. If your vehicle is equipped with anti-lock brakes and the anti-lock brake system warning light stays on, comes on or flashes, something may be wrong with the anti-lock brake system. See the Index under Anti-Lock Brake System Warning Light.</td>
</tr>
</tbody>
</table>

### Section D: Recommended Fluids & Lubricants

**NOTE:** Fluids and lubricants identified below by name, part number or specification may be obtained from your GM dealer.

<table>

**Customer Assistance Information**

**Customer Satisfaction Procedure**
Your satisfaction and goodwill are important to your dealer and Oldsmobile. Normally, any problems with the sales transaction or the operation of your vehicle will be resolved by your dealer’s Sales or Service Departments. Sometimes, however, despite the best intentions of all concerned, misunderstandings can occur. If your concern has not been resolved to your satisfaction, the following steps should be taken:

**STEP ONE:** Discuss your problem with a member of dealership management. Complaints can often be quickly resolved at that level. If the matter has already been reviewed with the Sales, Service or Parts Manager, contact the owner of the dealership or the General Manager.

**STEP TWO:** If after contacting a member of Dealership Management, it appears your problem cannot be resolved by the dealership without further help, contact the Oldsmobile Customer Assistance Network by calling 1-800-442-6537. In Canada, contact GM of Canada Customer Assistance Center in Oshawa by calling 1-800-263-3777 (English) or 1-800-263-7834 (French).

For prompt assistance, please have the following information available to give the Customer Assistance Representative:
- Your name, address, telephone number
- Vehicle Identification Number (This is available from the vehicle registration or title, or the plate attached to the left top of the instrument panel and visible through the windshield.)
- Dealership name and location
- Vehicle delivery date and present mileage
- Nature of problem
In order to give your inquiry prompt attention, please call the toll-free number listed above. However, if you wish to write Oldsmobile, write to:

**United States**
Customer Assistance Representative
Oldsmobile Central Office
820 Townsend St.
P.O. Box 30095
Lansing, MI 48909

**Canada**
Customer Assistance Center
General Motors of Canada Limited
Oshawa, Ontario L1H 8P7

A listing of all Oldsmobile Zone Offices and offices outside the U.S., which can assist you can also be found in the warranty booklet.

When contacting Oldsmobile, please remember that your problem will likely be resolved in the dealership, using the dealership’s facilities, equipment and personnel. That is why we suggest you follow Step One first if you have a problem.

---

**Customer Assistance for the Hearing or Speech Impaired**

To assist owners who have hearing difficulties, Oldsmobile has installed special TDD (Telecommunication Devices for the Deaf) equipment in its Customer Assistance Center. Any hearing or speech impaired customer who has access to a TDD or a conventional teletypewriter (TTY) can communicate with Oldsmobile by dialing: 1-800-TDD-GLDS. (TDD users in Canada can dial 1-800-267-3850.)
We prefer that you not resort to BBB AUTO LINE until after a final decision is made under the Customer Satisfaction Procedure. However, you may file a claim at any time by contacting your local Better Business Bureau (BBB) at the following toll-free number: 1-800-955-5100. For further information about filing a claim, you may also write to:

BBB AUTO LINE
Council of Better Business Bureaus
4200 Wilson Boulevard
Suite 800
Arlington, VA 22203

In order to file a claim, you will have to provide your name and address, the vehicle identification number (VIN) of your vehicle, and a statement of the nature of your complaint. BBB staff may try to help resolve your dispute through mediation. If mediation is not successful, or if you do not wish to participate in mediation, eligible customers may present their case to an impartial third-party arbitrator at an informal hearing. The arbitrator will render a decision in your case, which you may accept or reject. If you accept a valid arbitrator decision, GM will be bound by that decision. The entire dispute settlement process should ordinarily take about 40 days from the time you file your complaint to the time
a decision is rendered (or 47 days if you did not first contact your dealer or Oldsmobile).

We encourage you to use this program before or instead of resorting to the courts. We believe it offers advantages over courts in most jurisdictions because it is fast, free of charge, and informal (lawyers are not usually present, although you may retain one at your expense if you choose). Arbitrators make decisions based on the principles of fairness and equity, and are not required to duplicate the functions of courts by strictly applying state or federal law. If you wish to go to court, however, we do not require that you first file a claim with BBB AUTO LINE™ unless state law provides otherwise. Whatever your preference may be, remember that if you are unhappy with the results of BBB AUTO LINE, you can still go to court because an arbitrator’s decision is binding on GM but not on you, unless you accept it.

Eligibility is limited by vehicle age/mileage and other factors. For further information concerning the program, call the BBB at 1-800-955-5100. You may also call the Oldsmobile Customer Assistance Center.

* This program may not be available in all states, depending on state law. Canadian owners refer to your warranty booklet. General Motors reserves the right to change eligibility limitations and/or to discontinue its participation in this program.

** Some states may require that you file a claim with BBB AUTO LINE before resorting to state-operated procedures (excluding court).
Reporting Safety Defects to the United States Government

If you believe that your vehicle has a defect which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA), in addition to notifying General Motors. If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or General Motors.

To contact NHTSA, you may either call the Auto Safety Hotline toll-free at 1-800-424-9393 (or 366-0123 in the Washington, D.C. area) or write to:

NHTSA
U.S. Department of Transportation
Washington, D.C. 20590

You can also obtain other information about motor vehicle safety from the Hotline.

Reporting Safety Defects to the Canadian Government

If you live in Canada, and you believe that your vehicle has a safety defect, you should immediately notify Transport Canada, in addition to notifying General Motors of Canada Limited. You may write to:

Transport Canada
Box 8880
Ottawa, Ontario K1G 3J2

Reporting Safety Defects to General Motors

In addition to notifying NHTSA (or Transport Canada) in a situation like this, we certainly hope you'll notify us. Please call us at 1-800-442-6537, or write:

Oldsmobile Customer Assistance Network
P.O. Box 30095
Lansing, Michigan 48909

In Canada, please call us at 1-800-263-3777 (English) or 1-800-263-7854 (French). Or, write:

General Motors of Canada Limited
Customer Assistance Center
1908 Colonel Sam Drive
Oshawa, Ontario L1H 8P7
**Oldsmobile Roadside Assistance Program Features & Benefits**

The Oldsmobile Roadside Assistance program means help is just a toll-free call away—24 hours a day, 365 days a year.

Courteous and capable Customer Assistance Advisors are on-call to provide you with prompt assistance.

---

**24-Hour Oldsmobile Roadside Assistance Number**

1-800-535-0908 (6857) is the one number to call for assistance in the United States. Trained Customer Assistance Advisors, on-call to render assistance to Oldsmobile drivers, can dispatch roadside assistance and towing service, locate the nearest Oldsmobile dealership, take your request for an Oldsmobile computerized trip routing or simply answer any questions the Oldsmobile driver may have about the coverage provided by your Oldsmobile Roadside Assistance Program. The Oldsmobile Roadside Assistance number is fully staffed and operational 24 hours a day, 365 days a year.

---

**Who Is Covered?**

Oldsmobile Roadside Assistance covers all 1993 Oldsmobile vehicles.*

Coverage is for the Oldsmobile vehicle, regardless of the driver, and is concurrent with the Bumper-to-Bumper Plus warranty period.

Oldsmobile reserves the right to limit services or reimbursement to an owner or driver when in Oldsmobile’s judgement the claims become excessive in frequency or type of occurrence.

*In Canada, please consult your GM dealer regarding availability of Roadside Assistance.
Customer Assistance Information

Service Publications

Information on how to obtain Product Service Publications, Subscriptions and Indexes as described below is applicable only in the fifty U.S. states (and the District of Columbia) and only for cars and light trucks with GVWR less than 10,000 pounds (4,536 kg).

In Canada, information pertaining to Product Service Bulletins and Indexes can be obtained by writing to:

General Motors of Canada Limited
Service Publications Department
1908 Colonel Sam Drive
Oshawa, Ontario L1H 8P7

Oldsmobile regularly sends its dealers useful service bulletins about Oldsmobile products. Oldsmobile monitors product performance in the field. We then prepare bulletins for servicing our products better. Now, you can get these bulletins too.

Bulletins cover various subjects. Some pertain to the proper use and care of your vehicle. Some describe costly repairs. Others describe inexpensive repairs which, if done on time with the latest parts, may avoid future costly repairs. Some bulletins tell a technician how to repair a new or unexpected condition. Others describe a quicker way to fix your vehicle. They can help a technician service your vehicle better.

Most bulletins apply to conditions affecting a small number of cars or trucks. Your Oldsmobile dealer or a qualified technician may have to determine if a specific bulletin applies to your vehicle.

You can subscribe to all Oldsmobile bulletins. This way you'll get them as they come out. You can wait a while and get an index to the bulletins. You can also get individual bulletins. However, you'll need the index to identify them.
Subscriptions
You can subscribe to all Oldsmobile Product Service Publications (PSP’s). This will include bulletins for all vehicles sold by Oldsmobile and will not be limited to PSP’s applicable to any particular model. When you buy a subscription, you will receive the PSP’s in periodic mailings, shortly after they come out. A subscription costs $100 U.S. and includes a special binder, and it entitles you to all PSP’s published by Oldsmobile during the model year. You can purchase a subscription by sending a check or money order to Lansing Lithographers, P.O. Box 25188, Lansing, Michigan 48909, along with the order form located in the following text.

You may get additional subscription ordering forms by calling the toll-free number shown in the following text.
*Prices subject to change

Individual PSP’s
If you don’t want to buy all the PSP’s issued by Oldsmobile for all models in the model year, you can buy individual PSP’s, such as those which may pertain to a particular model. To do this, you will first need to see our index of PSP’s. It provides a variety of information. Here’s what you’ll find in the index and how you can get one:

What You’ll Find in the Index
• A list of all PSP’s published by Oldsmobile in a model year (1989 or later). PSP’s covering all models of Oldsmobile vehicles are listed in the same index.
• Ordering information so you can buy the specific PSP’s you may want.
• Price information for the PSP’s you may want to buy.
How You Can Get an Index

Indexes are published periodically. Most of the PSP's which could potentially apply to the most recent Oldsmobile models will be listed in the most recent publication for that model year. This means you may want to wait until the end of the model year before ordering an index, if you are interested in buying PSP's pertaining to a current model year car or truck.

Some PSP’s pertaining to a particular model year vehicle may be published in later years, and these would be listed in the later year's index. When you order an index for a model year that is not over yet, we'll send you the most recently published issue. Check the ordering form for indexes for earlier model years.

Cut out the ordering form, fill it out, and mail it in. We will then see to it that an index is mailed to you. There is no charge for indexes for the 1989-1993 model years.

Toll-Free Telephone Number
If you want an additional ordering form for an index or a subscription, just call toll-free and we'll be happy to send you one. Automated recording equipment will take your name and mailing address. The number to call is 1-800-551-4123.

Copies at Participating Dealers
Copies of indexes and individual PSP’s are at your participating Oldsmobile dealer. You can ask to see them.

A Very Important Reminder
These PSP’s are meant for technicians. They are not meant for the "do-it-yourselfer." Technicians have the equipment, tools, safety instructions, and know-how to do a job quickly and safely.

Oldsmobile Service Publications
You can get these by using the following order form. They include: Product Service Publications, Service Manuals and Owner Publications.

If the order form is missing, you can write:
Lansing Lithographers
P.O. Box 23188
Lansing, Michigan 48909
Publication Order Form

Oldsmobile Division service publications are intended for use by professional, qualified technicians. Attempting repairs or service without the appropriate training, tools, and equipment could cause injury to you or others and damage to your vehicle that may cause it not to operate properly.

Service Station Information

- **Battery**: The Delco Freedom® battery needs no water. See Page 240
- **Windshield Washer Fluid**: See Page 237
- **Cold Tire Pressure**: See Tire-Loading Information label on inside of trunk lid. See Page 253
- **Fuel**: Capacity 16.5 U.S. Gal. (62 L). Use unleaded gas only. 87 octane or higher. See Page 239
- **Engine Oil**: See Page 226
- **Cooling System**: Check and add coolant only at the coolant recovery tank. The fluid should be at the HOT mark when the engine is warm. If the engine is cool, the level should be at the COLD mark or a little higher. See Page 234
- **Transaxle Fluid**: See Page 231
- **Spare Tire Pressure**: Compact Spare: 60 psi (420 kPa). See Page 211

See Page 219
